Higher Foreign Supplies To Weigh on U.S. Export Demand

[Oil Crops Chart
Gallery](#) will be
updated on
March 13, 2017

The next release is
April 13, 2017

Approved by the
World Agricultural
Outlook Board.

Based on accelerating foreign competition, USDA trimmed its 2016/17 forecast of U.S. soybean exports by 25 million bushels this month to 2.025 billion. In contrast, strong year-to-date use prompted an increase in the 2016/17 forecast of the domestic crush this month by 10 million bushels to 1.94 billion. Season-ending soybean stocks for 2016/17 are then expected to edge 15 million bushels higher to 435 million bushels. On the basis of earlier priced sales, USDA revised its forecast of the U.S. season-average farm price to \$9.30-\$9.90 per bushel from \$9.10-\$9.90 last month.

Global soybean production for 2016/17 was forecast 4.2 million metric tons higher this month to 340.8 million. USDA forecast Brazilian soybean production 4 million tons higher this month to a record 108 million tons based on a record yield. A larger crop is seen expanding Brazilian exports to 61 million tons compared to last month's forecast at 59.5 million. A robust pace of trade since October led USDA to raise its forecast of 2016/17 soybean imports by China this month by 1 million tons to 87 million.

Rising Competition Dims Prospects for U.S. Soybean Exports

U.S. soybean exports typically go through a seasonal decline at this time of year. Compared to a month ago, the current weekly rate of shipments is down sharply. As of March 2, outstanding sales commitments are still comparatively high, though, which may moderate the decline in March exports. But with much brighter crop prospects in Brazil, the odds for a repeat of last summer's unusually strong exports are diminishing. Even with an abundance of soybean stocks remaining, new export sales are now expected to shrink with the accelerating foreign competition. Provided there are no major logistical difficulties in shipping South American new-crop soybean supplies—which fueled last summer's surge—the U.S. exports throughout the summer are unlikely to revive. As a consequence, USDA trimmed its 2016/17 forecast of U.S. soybean exports by 25 million bushels this month to 2.025 billion.

In January, the domestic soybean crush held steady at 170.6 million bushels, compared to 169 million in December. The cumulative crush for September 2016-January 2017 increased to 824.6 million bushels, exceeding the year-earlier pace by 3.3 percent. The data prompted USDA to raise its 2016/17 forecast of the domestic crush by 10 million bushels this month to 1.94 billion, versus 1.886 billion in 2015/16. Better-than-expected demand for soybean meal is largely responsible. USDA forecast domestic use of soybean meal 200,000 short tons higher this month to 34.3 million.

The forecast reduction in U.S. soybean exports this month more than offsets a higher crush. So, season-ending stocks are expected to edge 15 million bushels higher to 435 million bushels. A rise in the expected carryout and the likelihood of an increase in 2017 soybean acreage could pressure prices going forward. Despite this, a large proportion of old-crop soybeans have already been marketed at higher prices. On this basis, USDA's forecast of the U.S. season-average farm price is revised to \$9.30-\$9.90 per bushel from \$9.10-\$9.90 last month.

Soybean Oil Prices Pressured By Higher Output, Slower Demand

U.S. biodiesel production and imports surged in the final quarter of 2016 to take advantage of a \$1-per-gallon blending credit, which had expired as of January 1. EPA reported that 2016 production of biomass-based diesel topped 2.6 billion gallons. While this level is well above the year's requirement, biodiesel production can also help fulfill the law's advanced fuels mandate. Prior to the end of 2016, EPA had also announced an increase for the 2017 Renewable Fuels Standard blending obligations for biomass-based diesel—to 2 billion gallons from 1.9 billion in 2016. Unused credits (RINs) produced in 2016 can be applied toward the 2017 blending requirement as well.

Since January 1, however, biodiesel output has plunged in the absence of a blending credit and an abundant RIN carryover. Contrary to previous expectations, production cuts by crude oil exporters have not resulted in tightening inventories. In fact, U.S. crude oil stocks have now climbed to a record high, which has stalled the

rise in prices. One indication of the associated effect on the biodiesel market is the decline in Iowa biodiesel prices, which have fallen 13 percent since December.

Use of soybean oil in the production of biodiesel has correspondingly slumped. In January, a higher output and lower demand for soybean oil led to a rise in ending stocks for the month to 2.086 billion pounds from 1.872 billion in December. Season-ending soybean oil stocks for 2016/17 are also forecast higher this month to 1.772 billion pounds. An easing supply outlook is weighing on the current price level. Central Illinois soybean oil prices peaked in December at an average at 35.6 cents per pound but fell to a February average of 32 cents. Thus, the season-average price for 2016/17 is forecast at 32-35 cents per pound, compared to 34-37 cents last month.

Higher U.S. soybean oil exports are anticipated with an increase in production and a more competitive price level. As of March 2, export sales commitments of soybean oil were 14 percent higher than a year ago. Late-season sales may not be as high in 2016/17 as in 2015/16. But there may be enough sales already booked this season to match the 2015/16 total (2.24 billion pounds). USDA raised its soybean oil export forecast for 2016/17 by 100 million pounds this month to 2.25 billion.

Brazil's Superb Soybean Yields This Year Boost Its Export Potential

Global soybean production for 2016/17 is forecast 4.2 million metric tons higher this month to 340.8 million. Higher expected crops for Brazil and South Africa far exceed small reductions for the EU, Turkey, and Australia.

In Brazil, about half of the soybean harvest was nearly completed by early March. Record soybean yields are anticipated following mostly favorable growing season moisture throughout the country. USDA forecast Brazilian soybean production 4 million tons higher this month to 108 million. If realized, the 2016/17 crop would top last year's by 12 percent.

By February 2017, soybean exports from Brazil had accelerated to 3.5 million tons compared to 2 million a year earlier. For all of 2016/17, a larger crop is seen expanding exports to 61 million tons compared to last month's forecast at 59.5 million and 54.4 million tons for 2015/16. Recently, soybean shipments through northern ports were stalled by rainy conditions that have made unpaved roads impassable. However, these Amazon River ports typically account for only 6 percent of the country's annual exports of soybeans. The large majority of exports that pass through southern ports are proceeding well. A higher domestic crush of soybeans is anticipated also. The forecast of Brazil's 2016/17 crush is raised 500,000 tons this month to a record 41 million.

China Dominates Gains in Global Soybean Imports

The increases in soybean exports this year from the United States and Brazil would not be possible without more demand from China—the world's top importing country. China's October 2016-February 2017 soybean imports totaled 35.2 million tons, compared to 32.2 million a year earlier. The robust pace of trade encouraged USDA to raise its forecast of 2016/17 soybean imports by China by 1 million tons this month to 87 million. The increase in China's imports from 2015/16 (at 83.2 million tons) represents 77 percent of the gain in global soybean trade. Most of this month's gain in imported supplies is expected to support inventory levels at processing facilities. Season-ending soybean stocks in China are forecast up to 15.6 million tons from 14.9 million last month.

Australian Canola Exports To Benefit From a Bumper Harvest

In Australia, canola yields have achieved an all-time high in 2016/17 with optimal growing weather. The crop was well established after planting, and soil moisture throughout the July-August reproductive period was well above-average. Capping off an almost ideal growing season, drier harvest conditions emerged by October. Australian production of canola in 2016/17 is estimated at 4.1 million tons—an increase of 500,000 tons from the prior forecast. This would be just shy of the country's 2012/13 record (4.14 million tons) with 1 million hectares less area harvested than in that year.

With a good crop and firm prices for canola, Australian exports will take more of the burden of supplying 2016/17 world trade. Canola exports from Australia could

surge to 3.1 million tons this year, an increase of 300,000 from last month's forecast and up from 2.3 million in 2015/16.

Delayed Recovery in Malaysian Palm Oil Output Curbs Global Trade

Malaysian palm oil production for 2016/17 is forecast 500,000 tons lower this month to 19.5 million based on slow improvement in monthly output. Following an unusually low total for October, cumulative palm oil production for October 2016-January 2017 still lags the 2015/16 pace by 3 percent. Yet, with a robust second-half performance, Malaysian annual output is still expected to rebound from a sharp 2015/16 decline (to 17.7 million tons). By March, the country's much improved rainfall since early 2016 should foster a strong recovery of yields. This month's slightly tighter supply outlook for Malaysia is forecast to scale back 2016/17 palm oil exports by 500,000 tons to 17 million, still above 2015/16 trade at 16.6 million tons.

Even with a contraction in palm oil exports since October, Malaysian stocks for January fell to a 6-year low for the month at 1.541 million tons. Inventories may have bottomed out, though, as production will soon improve seasonally. As the output pace accelerates, Malaysian palm oil prices should ease again. Current prices have climbed to their highest level since April 2012.

Indian demand for vegetable oil imports has undergone a nearly uninterrupted expansion every year since 1992/93. This year, however, that import growth is tempered by larger domestic oilseed crops, particularly soybeans, peanuts, and rapeseed. Indian oilseeds production in 2016/17 is the second-highest ever and up 25 percent from 2015/16. At the same time, the import market for palm oil has been eroded by steadily rising costs. By January 2017, palm oil import prices in India were up 45 percent from the previous year. High prices for palm oil have reduced Indian imports for October 2016-January 2017 17 percent from a year earlier. Imports are likely to strengthen again once the domestic supplies of vegetable oil are exhausted. When this starts, soybean oil imports may be favored initially due to soybean oil's narrowing price spread with palm oil. A slow start for the 2016/17 season led USDA to lower its forecast of Indian palm oil imports this month by 400,000 tons to 9.6 million. No other country imports nearly as much, however.

Similarly, more moderate increases in 2016/17 palm oil imports are seen for China and Pakistan. Import forecasts for both countries are lowered 100,000 tons this month to 5 million and 3 million tons, respectively. In China, the strength of palm oil prices has encouraged more consumption of rapeseed oil, which has been acquired through more active purchases from auctions of Government reserve stocks. Higher expected production of soybean oil may also limit palm oil demand in China.

Data

Monthly tables from Oil Crops Outlook are available in Excel (.xls) spreadsheets at <http://www.ers.usda.gov/publications/ocs-oil-crops-outlook/>. These tables contain the latest data on the production, use, imports, exports, prices, and textile trade of cotton and other fibers.

Recent Report

Corn and Soybean Production Costs and Export Competitiveness in Argentina, Brazil, and the United States http://www.ers.usda.gov/media/2104953/eib-154_errata.pdf. This report explores export competitiveness of soybeans and corn in Argentina, Brazil, and the United States by comparing farm-level production costs, the cost of internal transportation and handling, and the cost of shipping to a common export destination. In addition, prices received by farmers and average yields for each crop in each country are analyzed to calculate producer returns.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and, where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

E mail Notification

Readers of ERS outlook reports have two ways they can receive an e-mail notice about release of reports and associated data.

- Receive timely notification (soon after the report is posted on the web) via USDA's Economics, Statistics and Market Information System (which is housed at Cornell University's Mann Library). Go to <http://usda.mannlib.cornell.edu/MannUsda/aboutEmailService.do> and follow the instructions to receive e-mail notices about ERS, Agricultural Marketing Service, National Agricultural Statistics Service, and World Agricultural Outlook Board products.

- Receive weekly notification (on Friday afternoon) via the ERS website. Go to <http://www.ers.usda.gov/subscribe-to-ers-e-newsletters.aspx> and follow the instructions to receive notices about ERS outlook reports, Amber Waves magazine, and other reports and data products on specific topics. ERS also offers RSS (really simple syndication) feeds for all ERS products. Go to <http://www.ers.usda.gov/rss/> to get started.
