U.S. Long-Grain 2016/17 Season-Average Rough-Rice Price Forecast Raised

There were only slight revisions this month to the U.S. 2016/17 rice balance sheet. Beginning stocks were raised 1 percent based on revisions to 2015/16. The 2016/17 export forecast was lowered 1.0 million cwt to 112.0 million cwt due to tighter expected supplies of medium- and short-grain rice. These revisions resulted in a 0.5-million cwt increase in ending stocks to 50.9 million cwt, the highest in 3 decades. Despite near-record total U.S. supplies of rice, the U.S. long-grain 2016/17 season-average price of rice was raised 50 cents on both ends to \$10.00-\$11.00 per cwt.

Global production remains projected at a record 480.7 million tons (milled basis), up 2 percent from a year earlier. There were no significant 2016/17 crop revisions this month. For 2015/16, production estimates were raised for India but lowered for Uruguay and Argentina due to heavy rains at harvest. Global rice consumption in 2016/17 is projected fractionally below production, pushing ending stocks up just 0.3 million tons from 2015/16 to 106.9 million tons.

Global trade in 2017 is projected to decline for a third consecutive year, with weaker imports from Sub-Saharan Africa and Southeast Asia the major factor. The only 2017 trade revision was a reduction in Burma's exports based on weaker shipments in 2016. The Philippines' 2016 import forecast was lowered. Through early June, global and U.S. trading prices were up from a month earlier, despite expectations of larger U.S. and global rice supplies in 2016/17.

Outlook Board.

Domestic Outlook

Progress of the U.S. 2016/17 Rice Crop Remains Ahead of Normal

Planting of the 2016/17 U.S. rice crop is nearly complete in all regions, with crop development slightly ahead of normal in most reported States, despite heavy rain in much of the South this spring. For the week ending June 5, 94 percent of the U.S. 2016/17 rice crop had emerged, even with a year earlier but ahead of the U.S. 5-year average of 91 percent. On the Gulf Coast, all of the Texas crop had emerged by June 5, up substantially from last year's rain-delayed 83 percent and 8 percentage points ahead of the State's 5-year average. In Louisiana, 99 percent of the 2016/17 rice crop had emerged by June 5, unchanged from the State's 5-year average but 1 percentage point ahead of last year.

In the Delta, 98 percent of Arkansas' 2016/17 crop had emerged by June 5, up 3 or 4 percentage points from a year earlier and the State's 5-year average. Mississippi's 2016/17 rice crop was reported 97 percent emerged by June 5, ahead of 90 percent last year and the State's 5-year average of 91 percent. All of Missouri's 2016/17 crop had emerged by June 5, well ahead of 85 percent a year earlier and the State's 5-year average 91 percent. In California, 74 percent of the 2016/17 rice crop had emerged by June 5, 20 percentage points behind the year earlier's record of 94 percent but ahead of the State's 5-year average of 78 percent.

Despite this year's faster pace of crop progress, conditions of the 2016/17 crop are rated below a year earlier in several Southern States, with heavy spring rains the main reason. In Arkansas, 57 percent of the 2016/17 crop was rated in good or excellent condition for the week ending June 5, down from 63 percent a year earlier. In addition, 16 percent of the 2016/17 Arkansas rice crop was rated in poor or very poor condition, down from 10 percent a year earlier. Much of the State received above normal rain this spring, with substantial flooding in some areas. In contrast, in nearby Missouri, 66 percent of the 2016/17 rice crop was rated in good or excellent condition for the week ending June 5, up from just 52 percent a year earlier. Like last year, 6 percent of Missouri's 2016/17 rice crop was rated in poor or very poor condition. The Mississippi 2016/17 crop was rated 78-percent good or excellent, virtually unchanged from a year earlier, with just 2 percent rated in poor or very poor condition in both years.

On the Gulf Coast, just 56 percent of the 2016/17 Texas crop was rated in good or excellent condition for the week ending June 5, down from 68 percent a year earlier. Ten percent of the Texas crop was rated in poor or very poor condition, double last year's share. Texas received substantial rain in late May that caused severe flooding. Rain has been especially strong in Texas over the past year, following 4 years of severe drought. Many Texas rice growers harvest a second partial crop—called a ratoon crop—from the stubble of the first crop remaining in the field after harvest. The time available to flood and harvest the ratoon crop before the weather becomes too cool is quite limited; thus, the heavy rains and flooding could hinder the ratoon crop planting. In Louisiana, 67 percent of the 2016/17 crop was rated in good or excellent condition for the week ending June 5, down from 71 percent a year ago. Five percent was rated in poor or very poor condition, about the same as a year ago. Like Texas, Louisiana growers in parts of the southwest typically harvest a ratoon crop. Southern growers farther north are unable to produce a ratoon crop due to the shorter growing season. Finally, 95 percent of California's crop was rated in good or excellent condition, up from 90 percent a year earlier. None of California's 2016/17 or 2015/16 crop was rated in poor or very poor

condition in early June. The weather in California in early June was extremely hot, sunny, and dry, very supportive of rice production.

Total U.S. Rice Supply in 2016/17 Projected at a Near-Record 297.9 Million Cwt

The only supply-side revision this month to the 2016/17 U.S. rice balance sheet was a 0.5-million cwt reduction in the beginning stocks forecast to 42.9 million cwt, 12 percent below a year earlier. The downward revision was due to slight changes in 2015/16 estimates, with small revisions made to both classes of rice. The combined medium- and short-grain 2016/17 carryin is forecast at 18.0 million cwt, down 1.0 million cwt from the previous forecast and 11 percent below a year earlier. Long-grain carryin is forecast at 23.0 million cwt, up 0.5 million cwt from last month's forecast but down 13 percent from a year earlier.

U.S. rice production in 2016/17 remains projected at 231.0 million cwt, the highest since 2010/11 and third-largest on record. The bumper crop—up 20 percent from a year earlier—is primarily due to a large area increase and a slightly higher expected yield. At 3.06 million acres, 2016/17 plantings are up 17 percent from a year earlier and the highest since 2010/11. The substantial area increase is largely due to a return of several hundred-thousand acres in the South not being planted last year due to adverse weather, a lack of economically viable alternatives at planting time in the southern States, and an end to water restrictions in the Texas rice belt. The area estimate is from the March *Prospective Plantings* report. The first survey of actual 2016/17 plantings will be released on June 30 in the *Acreage* report.

The average yield of 7,618 pounds per acre is up 2 percent from a year earlier and the second highest on record. The U.S. average yield forecast is based on 1996-2015 trends by class, with total production the sum of forecast production for both long-grain and combined medium- and short-grain. The first survey-based yield forecasts for all rice and by State will be released by NASS in the August *Crop Production* report. The yields are based on estimates by producers of their expected yields.

The 2016/17 long-grain crop remains projected at 181.0 million cwt, 36 percent above a year earlier and the highest since the 2010/11 record. The increase is primarily due to a large area expansion in the South. In contrast, combined medium- and short-grain production is forecast at 50.0 million cwt, 16 percent below a year earlier and the smallest since 1986/87. The decline is due to much smaller plantings in the South more than offsetting expanded area in California.

Total U.S. rice supplies in 2016/17 are projected at 297.9 million cwt, down 0.5 million cwt from last month's forecast but 13 percent larger than a year earlier and virtually equal to the 2010/11 record. Long-grain accounts for all of the projected supply increase in 2016/17. At 224.5 million cwt, long-grain supplies in 2016/17 are up 0.5 million cwt from the previous forecast and 25 percent higher than a year earlier. These are the highest long-grain supplies on record. In contrast, the medium- and short-grain supply is forecast at 71.5 million cwt, down 1.0 million cwt from the previous forecast and 14 percent below a year earlier and the smallest since 2008/09. The decrease in medium- and short-grain supply is the result of both a production decline and smaller carryin.

U.S. rice imports in 2016/17 remain projected at 24.0 million cwt, unchanged from the year earlier revised estimate but still below the 2014/15 record of 24.7 million cwt.

Long-grain imports in 2016/17 remain projected at 20.5 million cwt, unchanged from a year earlier. Thailand is expected to again account for more than 60 percent of U.S. long-grain imports, with its premium jasmine rice the bulk of its shipments. Basmati shipments from India and Pakistan are expected to account for much of the remaining sales. Medium- and short-grain imports remain projected at 3.5 million cwt, also unchanged from 2015/16. Specialty rice from Thailand accounts for the bulk of these shipments, with Arborio rice from Italy accounting for much of the remainder.

U.S. 2016/17 Export Forecast Lowered 1.0 Million Cwt to 112.0 Million Cwt

Total use of U.S. rice in 2016/17 is projected at 247.0 million cwt, down 1.0 million cwt from the previous forecast but up 11 percent from a year earlier and the second highest on record. Both domestic use (including a residual component) and exports are projected to be higher in 2016/17. At 135.0 million cwt, total domestic and residual use remains projected up 12 percent from a year earlier and is second only to the 2010/11 record of 136.9 million cwt. The 2016/17 forecast is based on the historic share of total supplies accounted for by domestic and residual use. Much of the expected increase can be attributed to a larger residual component that includes higher post-harvest losses associated with a bumper crop. Long-grain domestic and residual use remains projected at 105.0 million cwt, up 19 percent from a year earlier and the second highest on record. In contrast, medium- and short-grain domestic and residual use is forecast to decline 9 percent to 30.0 million cwt, a result of smaller supplies.

U.S. rice exports in 2016/17 are projected at 112.0 million cwt, down 1.0 million cwt from the previous forecast but 11 percent higher than a year earlier and the highest since 2010/11. The slight downward revision this month was based on tighter supplies of medium- and short-grain rice. The substantial year-to-year increase in U.S. rice exports is based on much larger supplies and more competitive U.S. prices. By market, Sub-Saharan Africa and the Middle East provide the most opportunity for expanded U.S. sales in 2016/17. This year, U.S. sales to Sub-Saharan Africa have been especially weak. More competitive prices would likely boost U.S. sales there and in some Western Hemisphere markets as well. Currently, the Western Hemisphere accounts for more than 60 percent of U.S. exports, with Northeast Asia the next largest market—taking virtually all medium- and short-grain. While the United States faces substantial competition from Asian exporters in Europe, Asia, the Middle East, and Sub-Saharan Africa, little Asian rice is shipped to Latin America, with Vietnam's substantial annual sales to Cuba a major exception.

Long-grain exports remain projected at 81.0 million cwt, 17 percent above a year earlier and the highest since 2005/06. Latin America is the largest market for U.S. long grain rice, taking more than 70 percent of U.S. long-grain shipments, with rough rice accounting for the bulk of the shipments. Canada and the Middle East account for most of the remaining sales, with Sub-Saharan Africa often a buyer as well. Long-grain shipments to these three markets are milled rice.

Combined medium- and short-grain exports are projected at 31.0 million cwt, down 1.0 million cwt from the previous forecast and 3 percent below the year earlier's revised forecast. Almost all U.S. shipments to Northeast Asia are part of WTO purchases by Japan, South Korea, and Taiwan, with California supplying nearly all U.S. sales to these three buyers. Most of the remaining U.S. medium- and short-grain exports are sold to North Africa and the Middle East, with the South often supplying much of these sales. Turkey, Libya, and Jordan are typically the largest buyers of U.S. rice in this region.

U.S. sales to Turkey—typically the largest U.S. buyer in the region—have been quite small since October 2015.

By type, 2016/17 U.S. rough rice exports remain projected at 35.0 million cwt, 4 percent above the year earlier revised estimate. Milled rice exports (combined milled- and brown-rice exports on a rough-rice basis) are projected at 77.0 million cwt, down 1.0 million cwt from the previous forecast but 14 percent above a year earlier and the highest since 2010/11. The downward revision is based on tighter supplies of medium- and short-grain rice.

U.S. 2016/17 Rice Ending Stocks Projected To Be the Highest in Three Decades

U.S. 2016/17 rice ending stocks are projected at 50.9 million cwt, up 0.5 million cwt from the previous forecast and 19 percent larger than a year earlier. These are the largest ending stocks since 1986/87. The substantial buildup in stocks is the result of a large increase in supplies not being fully offset by expanded use. The 2016/17 stocks-to-use ratio is projected at 20.6 percent, up from an already high 19.3 percent a year earlier. This would be the third consecutive year of an abnormally high stocks-to-use ratio.

For long-grain rice, ending stocks are projected at 38.5 million cwt, up 0.5 million cwt from the previous forecast and 67 percent larger than a year earlier. These are the highest long-grain ending stocks since 1985/86. The 2016/17 long-grain stocks-to-use ratio is projected at 20.7 percent, up from 14.6 percent a year earlier and the highest since 1986/87. In contrast, combined medium- and short-grain ending stocks remain projected at 10.5 million cwt, 42 percent below a year earlier and the lowest since 2008/09. The medium- and short-grain stocks-to-use ratio is projected at 17.2 percent, down from an abnormally high 27.6 percent a year earlier.

2015/16 U.S. Rice Import and Export Forecasts Raised

There were two small revisions to the 2015/16 U.S. rice balance sheet this month. On the supply side, the 2015/16 import forecast was raised 0.5 million cwt to 24.0 million cwt, 3 percent below a year earlier. The upward revision was based on Census trade data through April and expectations regarding imports the remainder of the 2015/16 market year. Long-grain accounted for all of the upward revision in 2015/16 imports. A major factor in the upward revision was an unexpected purchase of nearly 24,000 tons of broken kernel rice from Brazil that arrived in March. Through April, U.S. rice imports from Southeast Asia have been behind a year earlier, while imports from South Asia are well ahead of last year's pace. These two regions typically supply more than 85 percent of U.S. rice imports, with aromatic varieties accounting for nearly all of these purchases.

On the use side, the 2015/16 medium- and short-grain export forecast was raised 1.0 million cwt to 32.0 million cwt, up nearly 8 percent from a year earlier. The upward revision was largely based on stronger-than-expected recent sales of southern rice to North Africa and the Middle East, partly a response to falling U.S. prices. By type of rice, U.S. rough-rice exports were raised 0.5 million cwt to 33.5 million cwt and milled-rice exports (milled and brown rice exports on a rough-basis) were raised 0.5 million cwt to 67.5 million cwt.

These revisions resulted in a 0.5-million cwt reduction in the 2015/16 U.S. ending stocks forecast to 42.9 million cwt, 12 percent below a year earlier. The 2015/16 long-grain

ending stocks forecast was raised 0.5 million cwt to 23.0 million cwt due to the higher import forecast. The combined medium- and short-grain 2015/16 ending stocks forecast was lowered 1.0 million cwt to 18.0 million cwt, 11 percent below a year earlier, a result of higher exports.

U.S. 2016/17 Long-Grain Season-Average Price Forecast Raised

The U.S. all-rice 2016/17 season-average farm price is projected at \$11.60-\$12.60 per cwt, compared with a revised \$12.10-\$12.50 in 2015/16. The U.S. long-grain 2016/17 season-average farm price (SAFP) is projected at \$10.00-\$11.00 per cwt, up 50 cents on both the high and low ends from a month earlier. The midpoint is 50 cents below the mid-point of the 2015/16 long-grain SAFP of \$10.90-\$11.10. This month's upward revision was based on current and expected higher global trading prices and stronger-than-expected prices for forward sales recently reported in the Delta. The stronger forward prices for U.S. long-grain rough rice forward sales are largely the result of increases in futures prices over the past 2 months, with soybean futures prices rising sharply, mostly a response to weather problems in southern South America during harvest. The small year-to-year decline in the mid-point of the long-grain SAFP is based on much larger U.S. supplies and the need for greater price competitiveness in global markets in order to export more rice in 2016/17. The 2016/17 long-grain SAFP would be the lowest since 2006/07, which was prior to the substantial increase in rice prices that occurred in 2007/08.

The U.S. medium- and short-grain SAFP in 2016/17 remains projected at \$15.40-\$16.40 per cwt, compared with a revised \$15.20-\$15.60 a year earlier. The 2015/16 medium- and short-grain SAFP was lowered this month based on a weaker forecast for the southern medium- and short-grain SAFP and a smaller share of marketings coming from California. In 2016/17, California is projected to account for its historic share of medium- and short-grain marketings, compared with abnormally low shares in 2014/15 and 2015/16 due to the California drought and expanded area in the South, giving the U.S. medium- and short-grain price a slight boost. California medium-grain rice nearly always sells at a higher price than southern medium-grain.

By region, the California 2016/17 medium- and short-grain SAFP remains projected at \$17.50-\$18.50 per cwt, compared with \$18.00-\$18.40 a year earlier. A large carryin and expanded area account for the lack of any price strength in California. In the South, the 2016/17 medium- and short-grain SAFP remains projected at \$10.50-\$11.50 per cwt, compared with a slightly revised SAFP in 2015/16 of \$11.20-\$11.40. Despite much smaller plantings, southern medium-grain prices will be under price pressure from larger supplies of California medium- and short-grain rice.

In late May, NASS reported an April long-grain rough-rice cash price of \$11.75 per cwt, down 25 cents from a month earlier and the lowest since August. For U.S. medium- and short-grain rice, the April price was reported at \$13.80 per cwt, down 70 cents from February and the lowest since November 2007. By region, the California March medium- and short-grain price was reported at \$17.80 per cwt, unchanged from March but \$2.40 below the start of the California 2015/16 market year in October. In the South, the March medium- and short-grain price was reported at \$10.40 per cwt, down 40 cents from March. The southern medium- and short-grain rough-rice price has dropped each month in 2015/16.

International Outlook

South America's 2015/16 Production Estimate Lowered; India's 2015/16 Crop Raised

Global rice production in 2016/17 is projected at a record 480.7 million tons (milled basis), virtually unchanged from last month's forecast but up 2 percent from a year earlier. In 2015/16, a historically strong El Nino reduced rice crops in several regions, most significantly in Latin America, Southeast Asia, and South Asia. Recoveries are projected for each of these regions in 2016/17. The substantial increase in global production is primarily due to expanded area. At 161.1 million hectares, global rice area is up 2.7 million hectares from a year earlier but still 0.6 million below the 2013/14 record. Brazil, Burma, Cambodia, China, India, Indonesia, the Philippines, Sub-Saharan Africa, and the United States account for the bulk of the global area expansion in 2016/17, with India, Indonesia, and the United States accounting for almost half the increase. The global area expansion is largely due to producer support programs in several Asian countries and a desire by many countries to rebuild stocks after El Nino reduced production in 2015/16. The average global yield of 4.45 tons of rough rice per hectare is up fractionally from 2015/16 and the highest on record. However, the average global yield has hardly risen since 2012/13.

By region, the largest increase in global production in 2016/17 is projected for Southeast Asia, where crops in nearly all countries were reduced in 2015/16 due to El Nino. At 115.0 million tons, rice production in Southeast Asia is up 4 percent from 2015/16, but still below the record 116.9 million tons harvested in 2013/14. The region is the world's largest source of rice exports and includes several major importers. South Asia is also expected to increase production in 2016/17. Production in the region is forecast at 153.5 million tons, up more than 1 percent from 2015/16 but still below the 2013/14 record. The region is the second largest rice exporting region in the world. East Asia is projected to harvest another record rice crop in 2016/17, projected at 160.9 million tons, an increase of almost a half a percent. China accounts for almost all of the production growth in East Asia over the past decade. Central America, North America, and South America are expected to see strong recoveries from below normal crops in 2015/16, which were mostly reduced by adverse weather. Despite a 3-percent area expansion, rice production in Sub-Saharan Africa is projected to be up less than 2 percent in 2016/17. These regions together account for almost 98 percent of global rice production.

There were only minor revisions to the 2016/17 global production forecasts this month. The only production change was an 8,000-ton increase in Mexico's forecast to 173,000 tons based on a higher yield reported by the Government of Mexico. Production is up 8 percent from a year earlier, and the yield of 6 tons per hectare is the highest on record. Mexico is the largest export market for U.S. rice. Mexico relies on imports for more than 80 percent of its domestic use, with the U.S. supplying the bulk of this rice. The only other revision for 2016/17 was a 0.5-million hectare increase in India's 2016/17 rice area to 44.0 million hectares based on data from the Government of India's *Third Advanced Estimate* released in May. India's 2016/17 area is up 1 percent from 2015/16 but still below the 2008/09 record of 45.4 million hectares. Planting of the kharif crop—which accounts for about 85 percent of India's total annual rice production—has just begun. The Government of India recently announced it was raising its support price for common grades of rice by 4 percent for the 2016/17 crop.

There were several production revisions for 2015/16 this month. First, India's 2015/16 rice production estimate was raised 0.5 million tons to 103.5 million tons due to more

area. At 43.5 million hectares, India's 2015/16 rice is up 0.7 million hectares from the previous estimate but still almost 0.7 million hectares below a year earlier. In 2015/16, an erratic and insufficient monsoon related to El Nino reduced India's crop 2.0 million tons from a year earlier. These revisions are from the Government of India's *Third Advanced Estimate*. Mexico's 2016/17 production estimate was raised slightly to 160,000 tons based on Government data indicating a higher yield.

These two upward revisions were partially offset by two reductions in South America. First, Uruguay's 2015/16 crop was lowered 70,000 tons to 770,000 tons due to reduced area caused by heavy rains and flooding in April and May at the peak of harvest. The heavy rains impacted most of southern South America. Uruguay's crop is down 21 percent from 2015/15. Second, in nearby Argentina, the 2015/16 production estimate was lowered 32,000 tons to 1.4 million tons due to smaller area reported by the Ministry of Agriculture resulting from severe flooding in parts of the country during the recent harvest. Both Argentina and Uruguay are mid-level exporters who produce rice primarily for export. In southern South America, the main 2015/16 harvest has only recently been completed and the full impact of this year's severe El Nino-related flooding may not yet be fully known. In addition to Argentina and Uruguay, the region includes Brazil and Paraguay, who are also mid-level rice exporters.

Stocks of Rice Held by Major Exporters Continue To Tighten

Global consumption for 2016/17 is forecast at a record 480.4 million tons, down just 0.1 million tons from last month's forecast but 1.7 million tons larger than a year earlier and nearly equal to production. Bangladesh, Brazil, Burma, India, Japan, the United States, and Thailand account for the bulk of the expected increase in global consumption in 2016/17. In contrast, consumption is expected to decline in 2016/17 in China and Nigeria and to be unchanged from 2015/16 in Indonesia. Consumption forecasts for all countries include feed and industrial uses, as well as a residual component that accounts for post-harvest losses.

With global consumption and production nearly the same, total ending stocks of 106.9 million tons are up 0.3 million from both the previous forecast and a year earlier. China's 2016/17 ending stocks are projected to increase 10 percent to 68.1 million tons, the highest since 2001/02. The substantial increase is the result of record production, near-record imports, and slightly smaller use. China is expected to account for almost 64 percent of global ending stocks in 2016/17. U.S. rice stocks are projected at 1.6 million tons, up 19 percent from a year earlier and the highest since 1986/87. In contrast, Thailand's 2016/17 ending stocks are projected to decline 47 percent to 3.2 million tons as the Government continues to sell off its accumulated stocks of back-year rice and the country harvests its second below normal crop. Thailand's stocks are projected to be the lowest since 2007/08, prior to the implantation of the paddy pledging program in late 2011 that led to a substantial buildup in stocks. India's 2016/17 ending stocks are projected to decline 15 percent to 11.7 million tons based on strong domestic demand and continued exports. The global stocks-to-use ratio is projected at 22.2 percent, nearly unchanged from a year earlier.

However, analysis of 2016/17 ending stocks by specific categories indicates a much tighter global stocks situation. First, global ending stocks, excluding China's stocks, are projected at 38.9 million tons, down 13 percent from a year earlier and the fourth consecutive year of decline. These are the lowest global ending stocks (excluding China's stocks) since 2004/05. In 2004/05, global rice prices were on a slow rise that

would continue until late 2007 when the 2007/08 price spike began. Second, 2016/17 ending stocks held by the top 7 exporters—Burma, Cambodia, India, Pakistan, Thailand, the United States, and Vietnam—are forecast at 19.4 million tons, down 19 percent from a year earlier and the fourth consecutive year of decline. These are the lowest ending stocks held by these top 7 exporters since 2006/07, just prior to the rapid increase in rice prices in 2007/08. In 2016/17, ending stocks are projected to decline in India, Pakistan, and Thailand. El Nino-related crop losses were critical factors behind the smaller stocks. The expected substantial decline in stocks held by the major exporters is a likely factor behind the recent strength in global trading prices.

Burma's 2016 and 2017 Export Forecasts Lowered

There were few 2016 and 2017 global trade revisions this month. Global rice trade in 2017 is projected at 40.6 million tons, down just 0.1 million tons from the previous forecast and 2 percent below a year earlier. This will be the third consecutive year of declining global trade. Among the exporters, in 2017 reduced shipments by India, Pakistan, and Thailand are not projected to be fully offset by increased exports from Argentina, Burma, Cambodia, and the United States. On the importer side, smaller imports by Brazil, Cote d'Ivoire, Indonesia, and Nigeria are not expected to be fully offset by increased purchases by Bangladesh, the Dominican Republic, Madagascar, Mexico, Nepal, Saudi Arabia, Sierra Leone, Turkey, and the United States. Over a longer period, the 8-percent decline in global rice trade since the 2014 record of 44.1 million tons has been largely due to smaller imports by Sub-Saharan Africa and South Asia. For Sub-Saharan Africa, the decline in imports is partly due to higher production—which is up 10 percent from 2013/14—as many countries seek self-sufficiency. Similarly, Bangladesh has steadily increased rice production, with imports now just 1-2 percent of use.

The only 2017 export revision this month was a 0.1-million ton reduction in Burma's exports to 1.75 million tons, still up 0.1 from this year's revised forecast. The downward revision was based on a recent slower pace of sales and continuation of constraints to border trade. There were no 2017 import revisions this month. For 2016, Burma's exports were lowered 0.15 million tons to 1.65 million tons based on a slower pace of shipments to date. Burma's 2016 exports are down 5 percent from a year earlier. Brazil's 2016 exports were raised 50,000 tons to 800,000 tons based on shipment pace. Through May, Brazil's shipments to Senegal, Nicaragua, Peru, Venezuela, and the United States were well ahead of a year earlier.

There were only two 2016 import revisions this month. First, the Philippines 2016 import forecast was lowered 0.3 million tons to 1.5 million tons, down 25 percent from a year earlier. The substantial downward revision was based on a recent slower pace of imports and adequate supplies, despite some crop damage in 2015/16 that was related to El Nino. Second, the U.S. 2016 import forecast was increased 15,000 tons to 765,000 tons based on recent strong purchases. U.S. rice imports have more than doubled since 2000.

Global Trading Prices Rose in Mid-May

Prices for most grades of Thailand's regular-milled white rice increased 2-3 percent in mid-May, mostly due to tighter old-crop supplies, concerns over the size of the final 2015/16 dry-season crop, inquiries from African buyers for parboiled rice, and concerns

over adequate rainfall for the timely planting of the 2016/17 main crop. Since mid-May, Thailand's prices have changed little.

Prices for Thailand's 100-percent Grade B milled white rice were quoted at \$416 per ton for the week ending June 6, up \$11 from the week of May 9 but down \$1 from late May. Thailand's prices began to slowly rise in mid-April after moving within a very narrow range since last August. Prices for Thailand's 5-percent broken rice were quoted at \$410 per ton for the week ending June 6, up \$12 from May 9 but unchanged since mid-May. Prices for Thailand's parboiled 5-percent broken rice—a specialty rice—were quoted at \$417 per ton, up \$10 from the week ending May 9 but nearly unchanged since mid-May. Thailand's premium jasmine rice was quoted at \$710 per ton for the week ending June 6, up \$15 from the week ending May 9. There have been no price quotes for Thailand's 100-percent broken rice since September 2015. All price quotes for Thailand's rice are from the *Weekly Rice Price Update* reported by the U.S. Agricultural Office in Bangkok.

For the week ending June 7, price quotes for Vietnam's high-quality 5-percent-broken kernels were quoted at \$375 per ton, up \$3 from the week ending May 10 but down \$5 from the week ending May 23. Vietnam's prices are limited by continued large auctions of Thailand's Government-held stocks and expectations of additional supplies from Vietnam's upcoming summer-autumn harvest in the Mekong River Delta. For the week ending June 6, Vietnam's prices were \$35 below price quotes for similar grades of Thailand's rice. Vietnam's rice typically sells at prices \$20-\$40 per ton below prices for comparable grades of Thailand's rice.

U.S. prices for long-grain milled-rice have also risen over the past month, partly a response to higher global rice prices and stronger prices for other commodities, primarily soybeans. For the week ending June 7, prices for high-quality U.S. Southern long-grain rice (No. 2, 4-percent broken, bagged, free on board (fob) vessel, U.S. Gulfport) were quoted at \$515 per ton, up \$5 from the week ending May 10. In fact, prices were \$510 per ton throughout May. The U.S. price difference over Thailand's 100-percent Grade B milled rice was \$99 per ton, down \$6 from a month earlier and well below the record of more than \$200 in October and November. Prices for U.S. long-grain rough-rice (bulk, fob vessel, New Orleans) were quoted at \$290 per ton for the week ending June 7, up \$15 from the week ending May 10 and up \$35 from early April. Despite expectations of a bumper U.S. rice crop in 2016/17 and near-record supplies, futures prices for long-grain rough rice have risen since mid-April, largely a response to higher prices for other commodities.

Price quotes for California medium-grain milled-rice (Grade number 1, 4-percent broken, sacked, free on board, domestic mill) have declined over the past month. For the week ending June 6, prices were quoted at \$650 per ton, down \$25 from a month earlier. Export prices for California medium-grain milled-rice (4-percent broken, sacked, on board vessel in Oakland), were quoted at \$850 per ton for the week ending May 24—the most recent price available, down \$40 from the week ending May 3, but unchanged from the week ending May 10. Outside regular WTO sales to Northeast Asia, there have been few recent sales of California medium-grain rice. Price quotes for Vietnam, U.S. long- and medium-grain milled-rice, and U.S. rough-rice export prices are from the weekly *Creed Rice Market Report*.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and, where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

E mail Notification

Readers of ERS outlook reports have two ways they can receive an e-mail notice about release of reports and associated data.

- Receive timely notification (soon after the report is posted on the web) via USDA's Economics, Statistics and Market Information System (which is housed at Cornell University's Mann Library). Go to <http://usda.mannlib.cornell.edu/MannUsda/aboutEmailService.do> and follow the instructions to receive e-mail notices about ERS, Agricultural Marketing Service, National Agricultural Statistics Service, and World Agricultural Outlook Board products.

- Receive weekly notification (on Friday afternoon) via the ERS website. Go to <http://www.ers.usda.gov/subscribe-to-ers-e-newsletters.aspx> and follow the instructions to receive notices about ERS Outlook reports, Amber Waves magazine, and other reports and data products on specific topics. ERS also offers RSS (really simple syndication) feeds for all ERS products. Go to <http://www.ers.usda.gov/rss/> to get started.

-- = Not available. 1/ Stock totals by type omit broken, which are included in total stocks for all types of rice in table 1. 2/ Projected.

3/ Includes residual. 4/ Market year begins August 1. 5/ Accounts for the difference in beginning and ending stocks of broken.

Thus, total supply of medium/short-grain may not equal the sum of beginning stocks, production, and imports.

6/ The medium/short-grain season-average farm price (SAFP) largely reflects rice that is marketed through price pools in California. The pool price is not final until all the rice in the pool is marketed for the crop year.

Therefore, SAFP forecasts based on the average of NASS monthly prices and the final price may differ.

7/ Market year begins October 1.

NQ = No quotes. Bold denotes a back-year revision. 1/ Simple average of weekly quotes.

Market year average prices are simple average of monthly prices.

2/ Number 2, 4-percent broken, sacked. Prior to August 2015, free alongside vessel, U.S. Gulf Port.

Since August 2015, free on board vessel, U.S. Gulf port.

To convert to a free on board vessel price add \$25 per ton. 3/ Bulk, free on board vessel, New Orleans, LA.

4/ New price series. Number 1, maximum 4-percent broken, sacked, 25 kilogram, containerized, free on board, California mill.

5/ Nominal price quotes, long-grain, sacked, free on board vessel, Bangkok, Thailand.

6/ 100-percent broken, new price series. 7/ Long-grain, double-water-polished, bagged,

free on board vessel, Ho Chi Minh City. 8/ Revised. Please note previous months' revisions in bold. 9/ Preliminary.
