WHEAT: SOURCES OF U. S. SUPPLY, 1923-41

Total supplies in the United States are the largest on record. The United States began its 1941-42 marketing year with the largest carry-over and the second largest crop in its history.

WHEAT: DISTRIBUTION OF U. S. SUPPLY, 1923-40

The quantity of wheat used domestically and exported in 1940-41 was about the same as in 1939-40. The carry-over on June 30, 1941, however, was increased by about 100 million bushels, chiefly as the result of the large 1940 crop. The quantity for use as feed and seed in 1941-42 is expected to be somewhat reduced while that for food about unchanged. Exports are expected to remain at low levels.

#### Notes

1. 1923 to 1926: Bradford's, excluding country elevator stocks.
2. Stocks in merchant mills and elevators = 1923 and 1924 estimated in absence of actual figures; 1926-40, Bureau of Census figures raised to represent all merchant mills. Stored for others = 1923-25, estimated in absence of actual figures; 1930-40, Census Bureau figures raised to represent all merchant mills.
3. From reports of Foreign and Domestic Commerce of the United States. Imports include full-duty wheat, wheat paying a duty of 10 percent ad valorem, and dutiable flour in tons of wheat, and exclude flour for export as follows: 42,764 bushels in 1923-24; 108,096 bushels in 1928-29; 553,265 bushels in 1929-30; 213,290, 1930-40; and 169,670, 1940-41. Exports include only flour made from domestic wheat; 1923-35 estimated on basis of total exports less wheat imported for milling in bond and export adjusted for changes in carry-over; beginning 1936, figures for exports and shipments of flour wholly from United States wheat.
4. Includes durum wheat returned from Montreal, estimated at 1,600,000 bushels.
5. For 1937, excludes new wheat from states other than the ones reporting. For 1938 excludes new wheat from 13,800,000 bushels; for 1939 excludes 13,420,000 bushels; for 1940, 23,975,000 bushels; for 1941, 10,314,000 bushels; and for 1942, 12,390,000 bushels, reported as new wheat by Bureau of Census.
6. Shipment are to Alaska, Hawaii, Puerto Rico, and Virgin Islands (Virgin Islands prior to December 31, 1924, included with Domestic exports). 1940 estimated in absence of official figures.
7. Balancing item.
8. For individual items, see supply section of this table.
Farmers are now making plans for the seeding of winter wheat to be harvested in 1942. This issue of The Wheat Situation, therefore, has been prepared with particular reference to the outlook for the wheat crop to be seeded this fall.

Summary of the Outlook for the 1942 Wheat Crop

World wheat supplies in 1942 are expected to remain at high levels - even though total supplies are also expected to be very large with trade restricted and export prices low. In the United States, wheat prices will continue well above the export price-level of other surplus producing countries, with the Government loan program as the principal price-supporting influence.

Present indications are that the acreage seeded to wheat for harvest in 1942 for the country as a whole will about equal the national acreage allotment under the Agricultural Adjustment Act of 55 million acres. With marketing quotas in effect, actual seedings for 1942 probably will not differ materially from the allotted acreage.

If the total wheat seedings turn out to be about 55 million acres and average yields are obtained, production will total about 650 million bushels, or about 20 million bushels below probable domestic utilization. This reduction, together with such exports as we may have, would moderately reduce by the end of the 1942-43 marketing year the very large carry-over of about 640 million bushels in prospect July 1, 1942.
Summary of the Situation for the 1941 Wheat Crop

Domestic wheat prices are higher than a month ago. General optimism in speculative markets, the advance in commodity prices generally, and increased buying by millers and bakers have caused prices to advance toward loan values earlier this year than in the other years in which the loan program was in effect.

The domestic wheat supply for the year beginning July 1, 1941 is now indicated to be 1,340 million bushels, consisting of an indicated crop of about 953 million bushels and a carry-over of old wheat of 387 million bushels. The indicated supply is about 240 million bushels above the supply a year ago and about 100 million bushels larger than the record high in 1931. Domestic disappearance in 1941-42 is now estimated at about 670 million bushels. The quantity of exports is very uncertain because of unsettled conditions.

Total world wheat supplies in 1941-42 are expected again to be of record size. On the basis of present indications, the crop is about 50 million bushels larger this year than last. World wheat stocks on July 1 were at a new high for that date. Increases in stocks in Canada, the United States, and the Argentine more than offset reductions in Australia, Europe, and North Africa. On the basis of present crop prospects in the four overseas wheat surplus countries (United States, Canada, Argentina, and Australia) and curtailed world trade, surpluses are expected to be greatly increased in these overseas countries a year hence.

-- August 26, 1941

1/ All references to world acreage, production, and stocks exclude the U.S.S.R. and China.
ESTIMATED WHEAT STOCKS IN FOUR MAJOR EXPORTING COUNTRIES AS OF JULY 1, 1922-41, AND INDICATION FOR 1942

**Figure 1**

July 1 wheat stocks in the four overseas exporting countries in 1941 reached the highest levels on record, being about double the 10-year average, 1931-40. Stocks on July 1, 1942 are expected to reach new record levels.

Estimated wheat stocks in four major exporting countries, as of about July 1, 1922-41, and indication for 1942

**Notes:**

1/ Includes United States wheat in Canada. Includes small quantities of new wheat prior to 1937.
2/ Preliminary.
3/ Includes Canadian wheat in the United States.
4/ Includes Canadian wheat in the United States.

United States - Stocks on farms, in country mills and elevators, commercial, in merchant mills and elevators, and stored for others by merchant mills.
Canada - 1922-23, carry-over August 31, plus net exports and estimated retentions of flour during July and August; beginning 1924, carry-over July 31, plus net exports and estimated retentions of flour for July.
Argentina - Carry-over on December 31, plus exports and estimated domestic consumption, July 1 to December 31.
Australia - 1922-24, includes only plus estimated domestic consumption; beginning 1925, July 1 to December 31, carry-over on December 31, plus net exports and estimated domestic consumption July 1 to November 30.

Division of Statistical and Historical Research, Bureau of Agricultural Economics. Compiled as follows:
The total wheat acreage seeded for harvest in 1941 was 2 percent less than that seeded for the previous crop and the same as seeded for the 1939 crop. However, the 1939-41 acreages represented a very large reduction from seeding for the 1937 and 1938 crops, which were the largest in our history. The large production in 1941 reflects very high yields.

Division of Statistical and Historical Research, Bureau of Agricultural Economics.
Data from the Agricultural Marketing Service.
/ Preliminary.

The 46.3 million acres of winter wheat seeded for the 1941 crop was 2.6 million acres above sowings for the 1940 crop -- an increase of 5.5 percent. Yields in 1940 were above average and the crop large.
ACRES

Figure 4

The 17.2 million acres of all spring wheat seeded for the 1941 crop was 1.5 million acres below seedings for the 1940 crop — a decrease of 7 percent. Even with one of the smallest acreages in recent times, exceptional growing conditions resulted in a very large 1941 crop.

Division of Statistical and Historical Research, Bureau of Agricultural Economics. Data from the Agricultural Marketing Service. Preliminary.

During the 1934-36 period world wheat yields were considerably below average and production small. In more recent years large crops have resulted not only from large acreages but high yields as well. A small reduction in acreage took place in 1941.

Division of Statistical and Historical Research, Bureau of Agricultural Economics.

1/ Refers to year of harvest in Northern Hemisphere, although it includes data for the Southern Hemisphere where the harvest ends early the following year.

2/ Acreage harvested except the United States, Canada, and Argentina.

3/ Preliminary.
OUTLOOK FOR THE 1942 WHEAT CROP

BACKGROUND 2/ - The acreage seeded to wheat for harvest in 1941 in the United States was 63.5 million acres, 2 percent more than the 62.4 million acres seeded for harvest in 1940, and the same as was seeded for the 1939 crop. However, the 1939-41 acreages represent a very large reduction from seedings for the 1937 and 1938 crops, when 81.1 and 79.6 million acres, respectively, were seeded - the largest in the history of the country (tables, fig. 2-4). There were no national acreage allotments operative in 1937 and 1938. In 1939 the allotment was 55 million acres, in 1940 and 1941, 62 million acres.

World wheat acreage 3/ increased steadily over a period of years until in 1938 it reached 292 million acres. During the past 2 years it has declined, but at 270 million acres estimated for 1940, it was still at high levels compared with the acreage in the 20's (table, fig. 5). World production 3/ for a number of years did not increase with the upward trend in acreage, however, because of small yields per acre. In 1938 and 1939 yields were very high and the largest world crops in history were produced. In both of these years production exceeded consumption, and world carry-over stocks 3/ on July 1, 1940 were the largest in history.

World trade in wheat and flour declined sharply following the peak year 1928-29, largely as the result of drastic restrictions in imports and increased production in major importing countries. In the early part of this period, exports from the United States declined with those from other surplus-producing countries. During the period 1934-35 to 1936-37, small crops in the United States were followed by net imports (table 8). World wheat and flour exports in 1937-38 were about 518 million bushels, in 1938-39 about 638 million bushels, and in 1939-40 about 620 million bushels. With reduced shipping in 1940-41, as the result of the blockade and other conditions, exports of wheat and flour declined to about 450 million bushels. Net exports from the United States in 1937-38 were 99 million bushels, in 1938-39 they were 106 million bushels, in 1939-40, 45 million bushels, and in 1940-41 they were down to 34 million bushels.

The acreage allotted for seeding the 1942 crop under the Agricultural Adjustment Act is 55 million acres. This is 7 million acres smaller than the allotment in each of the 2 preceding years, when actual seedings exceeded

2/ See also background statements on pages 12 and 17.
3/ All references to world acreage, production, and stocks exclude the U. S. S. R. and China.
the allotments. However, with marketing quotas in effect for the first time, and the likelihood that many farmers with penalty wheat will reduce their acreage below their allotments in order to market such wheat in 1942-43 without penalty, it is very probable that the actual seedings in 1942 will not differ materially from the allotment.

If the total wheat seedings for harvest in 1942 turn out to be about 55 million acres, and the 20-year (1921-40) average yield per seeded acre of 11.8 bushels is obtained, production will total about 650 million bushels. This would be about 20 million bushels below probable domestic utilization, and the very large carry-over on July 1, 1942, forecast at about 640 million bushels, would be reduced by the end of the 1942-43 year by this quantity and by any exports which take place in 1942-43.

The annual average yields per seeded acre in the United States usually vary between about 10 and 14 bushels. A 10-bushel yield on 55 million acres would result in a crop about 120 million bushels short of probable domestic utilization. After allowing for exports, this would leave a carry-over of about 500 million bushels June 30, 1943—about 140 million bushels less than on July 1, 1942 but still over 100 million bushels above the stocks on July 1, 1941. If, however, a yield of 14 bushels is obtained on 55 million acres, a crop of 770 million bushels would result, which would mean that the carry-over on June 30, 1943 might exceed 700 million bushels.

The only insect seriously menacing the coming winter wheat crop is the hessian fly. It is present in abundance throughout most of the North Central States. Weather conditions adverse to the fly, such as prolonged drought from late August to October, inclusive, can prevent an unusually great emergence of this pest. The menace can be largely avoided by seeding winter wheat during the fly-free period (dates may be obtained from State entomologists or local agricultural agents).

Each year the acreage allotment is adjusted so that with the prospective carry-over it will provide wheat enough for normal domestic consumption, normal exports, and at least a 30-percent reserve. Since the 55-million-acre allotment minimum is above the level necessary to provide this objective, above-normal reserves will continue a definite part of the United States wheat situation until the world situation again provides a considerably larger export market than at present or unless yields per acre should be materially below average. Under present world conditions an ample carry-over of wheat is advisable as security against unforeseen emergencies.

It is too early to appraise the probabilities for the 1942 world wheat crop, but it now appears that the acreage will be slightly below that for 1940. The acreage in the United States will probably be reduced from the present 63-1/2 million acres to about 55 million acres, and the area in Canada is expected to remain below the high level of 29 million acres reached in 1940. Some reduction may be anticipated in Australia and Argentina, but the total acreage for the other countries of the world is not
expected to change much. A 5-percent reduction in acreage from the 1940 levels would mean an acreage of about 257 million acres. At the 15-year (1926-40) average yield per acre of 14.3 bushels, such an acreage would result in a crop of 3,675 million bushels. A crop of this size is less than probable world consumption in 1942 and would be expected to reduce the very large world stocks expected July 1, 1942. Stocks would be further reduced if hostilities should terminate and shipping to Europe be resumed in 1942-43, a situation which would increase consumption from present low levels.

World stocks July 1, 1942 will be of record size, however, and even though consumption exceeds production, such reduction as may take place will still leave a very large carry-over July 1, 1943.

With supplies in 1942-43 likely to continue to be very much larger than average, international wheat prices are expected to remain at relatively low levels. Wheat prices in the United States will continue well above world levels, however, so long as the Government loan program continues. In the past several years of such loans, prices have been considerably below loan values during the months shortly before and after harvest, gradually rising until they approximated the loan rate. A sharp rise in the general price level and optimistic speculative sentiment in commodity markets this summer have brought an earlier adjustment of prices to loan values for the 1941 crop. If a general price rise of sizeable proportions should occur, it is quite possible that prices would be carried to a level considerably above loan rates, despite large supplies and curtailed export markets. Such prices could prevail as long as farmers, dealers, and speculators in sufficient numbers were willing to carry the surplus wheat at such figures.

THE DOMESTIC WHEAT SITUATION FOR THE 1941 CROP

BACKGROUND.- In the 10-year period 1930-39 the carry-over of old wheat in the United States averaged about 230 million bushels, and domestic disappearance about 695 million bushels.

Domestic wheat prices from the spring of 1933 to the spring of 1937 were unusually high in relation to world prices as the result of small crops in the United States. In 1937 United States production was large and prices declined. In 1938, with domestic production again large, with a record world crop, and with lower commodity prices generally, prices again declined, and would have averaged still lower had it not been for the loan and export-subsidy programs which held domestic prices above export parity.

Prices received by growers for wheat during the year beginning July 1939, averaging 69 cents, continued relatively high compared with the usual relationship to prices in other countries, as a result of only a moderately large carry-over, reduced acreage, poor prospects for 1940 yields, and holding of wheat in expectation of higher prices.
Prices advanced sharply in September 1939, following the outbreak of the European war, and again in December, influenced by war developments and by poor crop prospects in Argentina and the United States. In the middle of May 1940, following the turn of events in Europe, selling became heavy and most of the gains were lost. From the middle of May until the middle of August prices declined seasonally, then they advanced until the middle of November. After declining to the middle of February, they again rose, influenced by new legislation affecting the loan rates, and are now at about the highest levels since May 1940.

The 1941 wheat loan rate, based on the July 1 parity price of wheat, represents an average national loan rate to farmers of approximately 98 cents per bushel. In 1938-39 the loan averaged 53 cents, in 1939-40, 64 cents, and in 1940-41, 65-1/2 cents. At important terminal markets the loan values for 1941 are as follows: No. 2 Hard Winter at Kansas City $1.10 and at Chicago $1.15, No. 2 Red Winter at St. Louis and at Chicago $1.15, No. 1 Dark Northern Spring at Minneapolis $1.15, and No. 1 Soft White at Portland $1.05.

United States wheat crop estimated 27 million bushels above indication of July 1

A total wheat crop of 951 million bushels was indicated by the Agricultural Marketing Service as of August 1. This is an increase of 27 million bushels over the production indicated a month earlier, with nearly all of the increase accounted for by the increase in the spring wheat crop. The mid-August report indicated a further increase of 2 million bushels in spring wheat for the four States of Minnesota, North Dakota, South Dakota, and Montana, which on August 1 accounted for 263 million bushels out of 266 million bushels for United States spring wheat as a whole. Assuming no change in the 3-million-bushel spring wheat production for which there was no mid-August report, a total wheat crop of 953 million bushels would be indicated. A crop of this size would be 17 percent above last year's crop of 817 million bushels and 27-1/2 percent above the 10-year (1930-39) average of 748 million bushels. The indicated yield per seeded acre at 15.0 bushels for all wheat compares with 13.1 bushels a year ago and with 11.8 bushels, the 20-year (1921-40) average.

The preliminary estimate of winter wheat production as of August 1 was 685 million bushels, which is larger than last year's production of 589 million bushels and the 10-year average of 569 million bushels by 16 percent and 20 percent, respectively. This preliminary estimate shows only a little increase over a month ago in total winter wheat production. In Kansas, Oklahoma, and Texas, where there was heavy crop loss due to excessive rain and delayed harvest, reports from wheat growers as of August 1 indicated still further reduction in production prospects from those indicated a month earlier. This was offset, however, by increases over July 1 indications in some eastern Corn Belt States and in most of the Western States. In these areas yields at harvest overran earlier expectations.
An indication of spring wheat, including durum, of 268 million bushels is 27 million bushels larger than indicated July 1, 40 million bushels more than the 1940 production, and 90 million bushels above the 10-year (1930-39) average. Production of durum wheat was indicated at 41 million bushels compared with 35 million bushels last year and the 10-year average of 28 million bushels. The production indicated for this year is the largest since 1930. Production of other spring wheat is placed at about 227 million bushels, an increase of 24 million bushels over the July expectations. Last year's production was 193 million bushels and the 10-year average 150 million bushels. There was less evidence of damage to other spring wheat than to durum during July from the high temperatures, and record high yields are in prospect for North Dakota, Idaho, and Washington.

United States old-wheat stocks

Stocks of old wheat in the United States on July 1, 1941, at the beginning of the new marketing year, are estimated at 387 million bushels, including 12 million bushels in the insurance reserve (chart and table, pages 1 and 2). July 1 stocks this year are the largest on record and exceed the previous high in 1932 by about 25 million bushels. The present estimate is 7 million bushels more than the forecast in March and 8 million less than that made in May. Stocks of old wheat on July 1, 1940 totaled 282 million bushels. Adding the indicated crop to the carry-over gives a domestic wheat supply for the year beginning July 1, 1941 of 1,340 million bushels. This is about 240 million bushels above the supply a year ago and about 100 million bushels larger than the record high in 1931.

The estimated July 1 carry-over of old wheat, current crop indications and probable prospective utilization, by classes, for 1941-42 are shown in table 1, and for 1940-41 in table 2. The disappearance indicated for 1941-42 of 670 million bushels is 7 million bushels less than in 1940-41 because a reduction in acreage will require less wheat for seed. Ordinarily with a higher price level relative to the price of corn there would be less feeding of wheat. However, with somewhat lower quality of wheat this year compared with the above-average quality last year and with a probable increase in demand for poultry and livestock feed, the quantity of wheat fed may not be much different from that in 1940-41. The higher income level expected in 1941-42 may about offset the effect on consumption of the advance in bread and flour prices, so that human consumption also may remain about unchanged.

Domestic wheat prices sharply higher

Domestic wheat prices are generally 5 to 11 cents higher than in mid-July. Cash prices reached about the highest levels since April and May 1940, and the Chicago May futures are at the highest level since April 1937. General optimism in speculative markets, the advance in commodity prices generally, and increased buying by millers and bakers have caused prices to advance toward loan values earlier this year than in the other years in which the loan program was in effect.

1/ Bureau of Census figures raised to represent all merchant mills and elevators. Includes stored for others as well as owned wheat in merchant mills and elevators.

2/ August estimate.

3/ From reports of Foreign and Domestic Commerce of the United States. Exports include only flour made from domestic wheat. Shipments are to Alaska, Hawaii, Puerto Rico, and Virgin Islands.

3/ Balancing item.
On August 25 the price of December futures at Chicago was at about loan levels, while cash prices were below loan values as follows: Hard winter at Kansas City 3 cents, red winter at St. Louis also 3 cents, dark northern spring at Minneapolis 10 cents, and soft white at Portland 10 cents. Prices of domestic spring wheat at Buffalo were about 5 cents higher than the price of Canadian wheat of comparable quality, c.i.f., duty paid, at the same market. Large-quantity imports are being prevented by import quota restrictions on wheat and flour. 4/

The likelihood that a very large quantity of wheat would be held off the market this year has been an important price factor since the time that legislation was introduced to raise the loan rates on the new crop. It now appears that the quantity of the 1941 crop to be placed under Government loan may be sufficient to cause wheat prices to advance above loan values. Of the 387 million bushels of old wheat carried over on July 1, 1941, 170 million bushels were in the Government pool and 12 million bushels in insurance stocks, leaving about 200 million bushels free wheat for sale or nongovernmental storage. Adding an indicated crop of about 950 million bushels makes a total supply of about 1,150 million bushels. Considering that about 150 million bushels are used on farms where grown for seed, feed, and food, about 500 million bushels by flour mills and about 100 million bushels for inventories and in transit from the close of the 1941-42 marketing year to the time that the 1943 crop will be used (a total of 750 million bushels), a supply of 1,150 million bushels would be only 400 million bushels in excess of needs. There were 278 million bushels placed under loan out of the 1940 crop, or about 43 percent of that part of the crop not actually used on farms where grown. If a similar percentage of the 1941 crop is placed under the loan the quantity would total about 350 million bushels. While much depends upon whether prices advance to attractive levels above loan rates while farmers are considering placing their wheat under loan, present indications are that 350 million bushels may be on the low side. Moreover, there is always considerable nongovernmental holding, so that wheat held off the market by governmental loans and by private storage may well exceed 350 million bushels.

THE WORLD WHEAT SITUATION

BACKGROUND.- Total world supplies of wheat2/ increased sharply from 1924 to 1933, largely as a result of increased acreage (figure 5). From 1934 to 1936, supplies declined, following successive years of small yields and increased world demand. Supplies increased slightly in 1937. With above-average yields on the large acreage, supplies in 1938, 1939, and 1940 were the largest on record, and prospects are for another large crop this year.

World wheat prices declined in the period 1924-33 with the increase in world supplies. The sharp decline in prices after 1929 was caused largely by the general decline in industrial activity and commodity prices. From the spring of 1933 to the summer of 1937, world wheat prices moved upward, reflecting world-wide recovery in commodity price levels, currency depreciation, and reduced production. The world price for the 1937 crop remained practically unchanged from that of a year earlier. In 1938, world prices again declined sharply as a result of record world production and weakness in demand. Prices in 1939-40 remained low but averaged higher than a year earlier, influenced by general expectations of increased demand for wheat as a result of the war, and by poor crop prospects in Argentina and the United States. In 1940-41 large supplies in surplus countries and reduced trade held world wheat prices to low levels.

5/ All references to world acreage, production, and stocks exclude the U.S.S.R. and China. Table on world supply and distribution was published in "The Wheat Situation" for March 1941, page 15.
World wheat production, excluding continental Europe, the U.S.S.R., and China may be 100 million bushels below 1940.

It appears that world wheat production, excluding Soviet Russia and China and also excluding continental Europe, may be about 100 million bushels below the 2,770 million bushels produced in the same countries in 1940. On the other hand, an increase of about 15 million bushels is now indicated for continental Europe, so that there is a net increase of about 25 million bushels indicated for the world, excluding the U.S.S.R. and China.

Reductions in the crops in Canada and India are expected to more than offset increases in the United States and Australia. The Canadian crop is tentatively placed at 310 million bushels — 290 million bushels for the Prairie Provinces on the basis of weather conditions to date, 4 million bushels of spring wheat grown elsewhere in Canada, and the officially estimated winter wheat crop of 16.4 million bushels. A crop of 310 million bushels would be about 140 million bushels less than the large crop in 1940. The crop in India is now officially estimated at 371 million bushels, compared with 403 million bushels a year ago. The present crop will provide a small surplus which will probably go to the Middle East. The United States crop at 953 million bushels is 136 million bushels larger than a year ago. On the basis of present conditions and assuming average weather for the rest of the season, production in Argentina may be about the same or only slightly less than the 271 million bushels last year, while that in Australia may be materially larger than the abnormally small production in 1940.

Reports indicate that the acreage in Argentina may be about equal to the acreage last year, despite the Government's efforts to get the growers to reduce plantings. Germination was reported better than usual, with crop conditions very satisfactory. In Australia conditions for the time being remain satisfactory, but New South Wales and Victoria need immediate rain to maintain present prospects. It now seems likely that there may be a reduction in acreage of only about 2 percent.

The 1941 wheat crop of China is estimated at 720 million bushels by the American consulate general at Shanghai, compared with 700 million bushels reported for 1940. The Japanese crop is officially forecast at 58 million bushels compared with 66 million bushels in 1940.

Present crop prospects in continental Europe still indicate a production of about 1,370 million bushels. This would be larger than the very small crop of about 1,245 million bushels produced last year but still below the 10-year (1931-40) average of 1,509 million bushels. In the southeast and south the harvest is about completed with yields largely unsatisfactory. Rain has interfered with harvesting in many areas in western Europe and have resulted in losses in some sections. In the Danubian countries, except Bulgaria, yields have been below average. Reports are particularly unfavorable for Hungary.

Continental Europe is excluded from the total because it is largely out of the world trade picture at the present time. This figure should not be confused with the previously published total which included continental Europe.
The crop in Greece is reported as small, and unless imports are permitted a serious shortage is expected. The Italian crop has been placed at 268 million bushels, the same as last year, but somewhat below usual requirements. The crops in Spain and Portugal are reported better than a year ago but in the case of the former still well below normal needs. In both unoccupied and occupied parts of France the crop is reported better than that of last year though still below average. In Sweden prospects are for a crop about the same as last year's poor crop. In the United Kingdom, the crop is fairly satisfactory, with good outturn expected from the larger acreage. In the U.S.S.R. the winter harvest is reported as largely completed in the southern areas, where yields are reported to be very good. While it is reported that a considerable quantity of the grain has been moved eastward, the loss in the west may be heavy as a result of war operations. Cutting of the spring crop is in progress.

Stocks in exporting countries at record high

Wheat supplies for export or carry-over in the four overseas exporting countries on August 1 are estimated at about 1,312 million bushels compared with 864 million bushels a year earlier (table 4). Stocks in Canada and the United States are at record heights and those in Argentina are second only to those in 1939. Increases in these stocks are far greater than the estimated reduction in the 1941 world crop, excluding continental Europe as well as the usual U.S.S.R. and China, and indicate that supplies in 1941-42 are at record heights.

1/ Carry-over at the beginning of the year (United States, July 1; Canada August 1; Argentina, January 1; Australia, December 1 of the previous year) plus production minus domestic utilization for the year, minus monthly exports to date, last month for United States, Australia, and Argentina estimated.

2/ Surplus from new crop not added.

3/ Based on official exports through February 1940, and unofficial estimates for succeeding months.
International Wheat Conference discusses wheat problems

Government representatives from Argentina, Australia, Canada, the United Kingdom, and the United States, who convened in Washington on July 10, 1941, to consider problems of the world wheat situation, recessed on August 3. A tentative agreement drawn up before the recess has been submitted to the respective governments with a request for further instructions to be presented at another meeting later this year.

The discussions of the delegates covered a wider range of subjects than those of previous international wheat conferences. Besides the old problem of sharing world markets on some equitable basis, post-war relief received considerable attention. In view of the record high level of world exportable stocks on July 31, which are considered sufficient to meet the normal requirements of importing countries during 2 years, the exporting countries are faced with the necessity for some form of production control. In many of the importing countries, on the other hand, particularly in Europe, reconstruction problems will arise from the distortion of agriculture under war conditions. Not only must some plan be devised to remedy these abnormalities, but it is also desired that greater post-war happiness for the people may be attained through applying to their relief the increasing knowledge of the relationship of food to health. By means of an international ever-normal granary, it is hoped that a large pool of relief wheat may be made available at prices reasonable both to consumers and producers and free of charge to those made destitute by war.

Prices in Winnipeg and Buenos Aires continue steady

Prices in both Winnipeg and Buenos Aires, where minimum prices are in effect, have continued to fluctuate very little, and average only slightly different from those a month ago. Prices of near futures in those two markets, together with prices in Chicago, Kansas City, and Minneapolis are shown in table 5.

The following fixed minimum carlot prices for wheat, basis in store Fort William or Vancouver, were set by the Canadian Wheat Board and approved by Order-in-Council August 1, 1941:

Imports for consumption from United States Tariff Commission, July 1923 to December 1933, and from Bureau of Foreign and Domestic Commerce, January 1934 to date.

1/ Beginning June 18, 1930, a new classification, wheat unifit for human consumption, was introduced by the 1930 Tariff Act.

2/ Wheat for grinding in bond for export, which enters duty free. Beginning June 18, 1930, includes wheat ground into flour in bond for export to Cuba, a new classification in the 1930 Act. From June 18, 1930 to September 3, 1936 the duty on this wheat equalled the reduction in Cuban duty and the reduction in the consumption tax applicable by treaty to such flour imported into Cuba. On September 3, 1936 the consumption tax was repealed.

3/ General imports prior to July 1934, subsequently imports for consumption. Beginning July 1934, excludes flour imported free for export in manufactured foods.

Effective January 1, 1939, the new trade agreement with Canada reduced the tariff to 5 per cent ad valorem on "wheat unifit for human consumption."

1/ See June 1941 Wheat Situation for latest available figures for countries other (3) shown. 2/ Includes flour milled in bond from foreign wheat. 3/ From Broomhall's Corn Trade News and Chicago Daily Trade Bulletin.
Rye crop about 14 percent above 1940

Production of rye in 1941 is estimated at 46.5 million bushels, 14 percent larger than the 1940 crop of 40.6 million bushels and 21 percent larger than the 10-year (1930-39) average production of 38.5 million bushels. Indicated production declined more than 2 million bushels during July as the very promising earlier prospects did not fully materialize in Minnesota, South Dakota, and Wisconsin—each an important rye-producing State. Indicated yields are above the 10-year average in all States except Minnesota, Iowa, Pennsylvania, Virginia, West Virginia, and Maryland where they equal the average or are only about one bushel or less below. Excellent yields—the highest in 10 to 20 years—are being secured in North Dakota, Indiana, Ohio, Kentucky, Colorado, Utah, Wyoming, Idaho, Washington, and Oregon.

Old crop carry-over 7 percent above year earlier

The United States stocks of rye at the beginning of the 1941-42 marketing year are estimated at 22 million bushels. A year ago the carry-over was 21 million bushels. With a crop indicated at about 46.5 million bushels the total supply of rye for the 1940-41 season will amount to 68.6 million bushels (table 10), compared with 62.7 million bushels a year earlier, and 59.5 million bushels, the 1936-40 average. The apparent disappearance of rye in 1940-41 was 40.3 million bushels, which was one half million bushels less than a year earlier and 1.2 million bushels less than the 1936-40 average. During 1936-40, of the average total disappearance of 41 million bushels, it is estimated that 9 million bushels were used for food, 9 million bushels for distilled spirits, 10 million bushels for seed, and 13 million bushels for feed.

</tbody>
</table>

1/ Less than 500 bushels.
2/ Indicated August 1.
3/ Imports excluded.
Growing conditions were again favorable for rye in 1941, and indicated production is 14 percent larger than in 1940 and 22 percent above the 10-year average, 1930-40. Production in 1940 was slightly larger and prices somewhat lower than a year earlier.
