World Agricultural Production

India's Rapeseed Production Boosted

The USDA forecasts India's 2008/09 rapeseed production at 7.0 million tons, up 0.42 million or 6 percent from last month, and up 1.55 million or 28 percent from last year. The area harvested is forecast at 6.6 million hectares, down 0.4 million from last month or 6 percent, but up 0.9 million or 16 percent from last year. A record yield is forecast at 1.06 tones per hectare, up 0.1 from last year or 11 percent. The latest government of India data indicates that *rabi* or winter season rapeseed planting is up from last year. The government's sowing progress report of March 13, 2009 shows the area planted estimated at 6.6 million hectares, compared to 5.98 million for the same time last season. USDA-FAS analyst's in-country field observations and discussions conducted in March, 2009 indicated that approximately 80 percent of the crop has been harvested. The estimated record yield and increase in rapeseed area from last season is due to favorable weather conditions throughout the growing season. In addition, farmers continue to respond to the strong Minimum Support Price (MSP) policy. Large harvests are expected in key

Approved by the World Agricultural Outlook Board

production regions of Rajasthan, Uttar Pradesh, and Haryana. (*For more information, contact, Dath Mita at 202-720-7339.*)

Argentine Soybeans Suffer through Season

The USDA forecasts Argentine soybean production for 2008/09 at 39.0 million tons, down 4 million tons, a 9 percent reduction from last month's 43.0 million tons. Area is estimated at 16.5 million hectares, a 4 percent decrease over last month's 17.2 million hectares. Yield is forecast at 2.36 tons per hectare, lower than last month's 2.50, compared to the record high 2.99 in 2006/07 and the 5-year average of 2.70.

The earlier hot and dry weather pattern continues decreasing pod number and limiting bean count and size within each pod. Scattered rains have not provided enough moisture to parched fields in order to salvage better-than-normal production. The diverse planting dates for soybeans have aided insect movement as pests continued to find harbor in more immature fields. The erratic rains, once thought to have helped second crop soybeans and some late-planted first crop beans, have not necessarily benefited plants into harvest. In some cases, indeterminate soybean plants have initiated flowering again, leaving plants with a wider mix of seed maturity in fields. In other cases, plants have increased late season-leaf canopy thus compromising seed-fill and yield.

During April temperatures dipped to 7°C for two nights within the province of Buenos Aires. This has elicited concern that some second crop soybeans as well as late-flowering first-crop beans may not make full maturity. Harvesting soy at low seed moisture is critical in Argentina as facilities are not available to dry down soybeans. Some seed lots have already come in with a portion of the harvest as immature green beans, lessening crop quality. By April 2, 2009, 25 percent of the crop had been harvested as compared to only 11 percent last year. With over 30 percent of the crop now out of the field, the hope is that more fields are not turned over to grazing or lost to frost, further lessen tonnage this year. (*For more information, contact Denise McWilliams 202-720-0107.*)

Argentine Grain Sorghum Limited in Yield

The USDA forecasts Argentine grain sorghum production for 2008/09 at 2.3 million tons, down 0.7 million tons, a 23 percent reduction from last month's 3.0 million tons. Area is estimated at 0.70 million hectares, the same as last month. Yield is forecast at 3.29 tons per hectare, down from 4.29 tons per hectare last month, compared to the record high 5.09 tons per hectare in 2002/03 and the 5-year average of 4.66 tons per hectare.

Even a heat-tolerant crop such as grain sorghum was not immune from the hot, dry conditions in Argentina this year. Much of the crop was planted later than normal. Panicle size varies greatly this season because of the variable heat, drought and available soil moisture reserves throughout the season. In drier areas, irregular grain filling is most noticeable, as well as quickening crop progress toward maturity. In some of these poor crop regions, fields are not being treated for aphids and sorghum midge.

Many fields show inconsistency in yields, particularly in the provinces of Santa Fe, Entre Rios and Buenos Aires. Grain sorghum in the province of Buenos Aires is showing irregular plant

development with physiological stages varying from flowering in the South to mature in the North. Sorghum within the province of Cordoba has some fields in good condition and others that show lack of moisture from the soil profile for final grain-fill. Fields are better near Venado Tuerto, but only with average yields. Within Entre Rios, seed development is mixed. Some fields are being converted from grain collection to forage. In this province, yields vary depending on amount of moisture received within the area. Crops within Santa Fe are generally poor, with some already directly grazed or harvested for forage use later. Within the department of San Jeronimo, near the town of Lopez, 60 percent of the crop is lost. Much of this crop was cut for forage in La Pampa. Crop condition is also very poor in Chaco. Temperatures for several consecutive days during the season were so high in one region of Chaco that some fields are showing leaf burn from sun scorch. *(For more information, contact Denise McWilliams 202-720-0107.)*

This report uses information from the Foreign Agricultural Service's (FAS) global network of agricultural attachés and counselors, official statistics of foreign governments and other foreign source materials, and the analysis of economic data and satellite imagery. Estimates of foreign area, yield, and production are from the International Production Assessment Division, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committee. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-467) April 11, 2009.

Printed copies are available from the National Technical Information Service. Download an order form at http://www.ntis.gov/products/specialty/usda/fas_a-g.asp, or call NTIS at 1-800-363-2068.

The FAS International Production Assessment Branch prepared this report. The next issue of World Agricultural Production will be released after 9:30 a.m. Eastern Time, May 9, 2009.

TABLE 18

The table below presents a 27-year record of the differences between the April projection and the final estimate. Using world wheat production as an example, changes between the April projection and the final estimate have averaged 2.1 million tons (0.4 percent) and ranged from -6.8 to 6.5 million tons. The April projection has been below the final 16 times and above the final 11 times.

1/ The final estimate for 1981/82-2007/08 is defined as the first November estimate following the marketing year.

2/ May not total 27 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
