CROP PRODUCTION

Released: January 11, 1984
3:00 P.M. ET

Crop Reporting Board
Statistical Reporting Service
U.S. Department of Agriculture
Washington, D.C. 20250

HIGHLIGHTS

ALL COTTON production estimated at 7.72 million bales, 35 percent below 1982 production but 1 percent above the December 1 forecast.

CITRUS production, forecast at 11.6 million tons (10.5 million metric tons), down 17 percent from December 1, 14 percent below last season and 3 percent less than 1981-82.

ORANGE production, forecast at 184 million boxes (7.15 million metric tons), down 17 percent from December 1, 18 percent below last season, but 4 percent more than 1981-82.

GRAPEFRUIT production, excluding California "other areas" crop, forecast at 54.0 million boxes (2.01 million metric tons), down 15 percent from December 1, 6 percent below last season and 20 percent less than 1981-82.

LEMON production, at 26.3 million boxes (905 thousand metric tons), 1 percent below December 1, 5 percent more than last season and 6 percent above 1981-82.

WINTER POTATO production forecast at 2.68 million cwt (121 thousand metric tons), up 22 percent from a year ago and 18 percent above winter 1982.

HAY STOCKS on-farms January 1, 1984 are estimated at 90.7 million tons (82.3 million metric tons), 15 percent less than a year earlier.

D. C. Johnson, D. L. Emslie.

DECEMBER HARVESTING PROGRESS

Torrential rains during early December slowed harvest and flooded low lying areas of the Delta States and Southeast. Standing water damaged some soybeans remaining for harvest in those areas and wet fields continued to delay completion of fieldwork in northern areas. At midmonth, harvest of the remaining acreage of corn and soybeans moved ahead over frozen fields in the Corn Belt until late in the month when snow stopped harvest. Only a few fields remain for harvest in most areas. Sleet and freezing rain halted soybean harvesting in the Southeast as the month ended. Cotton harvesting was ahead of schedule during December and centered on the southern Plains and the Southwest. At the month's end, harvesting was virtually complete except in New Mexico and the southern Plains where snow, ice, and freezing rain prevented completion. Harvest reached 98% completion by December 25, compared with 94% average. Except for the Southwest, Arctic air covered the Nation late in the month and brought record lows in many areas. Freezing temperatures moved into the Rio Grande Valley of Texas and central Florida causing severe damage to citrus and vegetables. Growers salvaged some vegetables and citrus and replanted vegetable fields as the month ended.

DECEMBER WEATHER SUMMARY

A succession of frigid arctic outbreaks pushed into to northern Plains early in the month and by the third week had covered all of the Nation except the Southwest. Many record low temperatures were broken. The third week of the month was one of the coldest of record. Frigid air pushed into the vegetable and citrus areas of southern Texas and then moved eastward and covered much of Florida. Low temperatures below 20°F severely damaged citrus fruit and trees and destroyed vegetables. After three days of freezing weather, afternoon temperatures rose to 80°F in central Florida and tempered the salvage operation. Snow covered the ground in much of the Nation offering a protective blanket to winter grains. Snow cover reached as far south as northern Texas, over the Appalachians and through the Northeast. Freezing rain fell from eastern Texas and Arkansas to northern Georgia and through the East Coast States into the Northeast. In contrast to the severely cold weather the Southwest remained warmer than normal all month. At the end of the month warmer Pacific air moved into the West and temperatures rose to above freezing for the first time in many weeks over the Plateau, the Rockies, and the high Plains. (Prepared by NOAA/USDA Joint Agricultural Weather Facility.)

WINTER WHEAT

Winter wheat seeding was finished in most areas by early December except in California and in some southeastern areas where a small portion of the crop had not been seeded. Nationally, wheat had emerged on 93% of the acreage. Progress lagged normal only in parts of Colorado and Kansas where dry soils had delayed seedings and slowed emergence. Precipitation was needed from western Kansas southward.

Abnormally cold weather pushed into the Nations midsection at midmonth threatening wheat with possible winterkill. However, most areas had sufficient snow cover to protect the crop. Late in the month, Arctic air covered the Nation except in the Southwest. Snow cover provided winter wheat with adequate protection from freezing temperatures in most producing areas, except in the southern Plains and portions of the Pacific Northwest where some winterkill of late-planted stands is expected. Rain and ice delayed completion of seeding across the South. Wheat was in fair to mostly good condition in all producing areas as the month ended. Overwintering conditions were generally good from Kansas northward. Wheat was dormant in Oklahoma and producers in the western part of the State were concerned about possible winterkill of late-planted fields. Growth was limited by freezing temperatures in Texas; some burning of foliage was evident. Stands were in good condition in Montana. Snow cover was adequate and wind damage was minimal.

COTTON: United States production expected to total 7.72 million bales, up 1 percent from December 1 but 35 percent less than last year's production. Upland estimated at 7.63 million bales and American pima at 90.5 thousand bales. Yield per acre at 506 pounds, down 84 pounds from record high 590 pounds in 1982.

Harvested area estimated at 7.33 million acres (2.97 million hectares), up 3 percent from December 1 due to lower than expected abandoment in Texas, but 25 percent below 1982.

Southeastern States production estimated at 394 thousand bales, down 1 percent from December 1 and 59 percent less than last year.

Production in Delta States estimated at 1.99 million bales, virtually unchanged from December 1 but 46 percent less than last year.

Texas and Oklahoma upland production at 2.50 million bales, up 2 percent from last month but down 15 percent from 1982. Favorable growing conditions during October and open harvest weather in November and December reduced expected abandonment in Texas. Acres for harvest estimated at 3.50 million in Texas compared with 3.30 million December 1.

Western States upland production estimated at 2.74 million bales, up 1 percent from last month but down 36 percent from last year. Harvest in final stages. Ginning from modules continues.

Bureau of Census reports 7,214,486 running bales ginned prior to January 1, 1984 compared with 10,574,010 bales ginned to the same date in 1983 and 13,460,093 bales for the 1981 crop.

COTTONSEED: Production based on three year lint-seed ratio estimated at 3.11 million tons (2.82 million metric tons), 35 percent below 1982 production.

ORANGES: U.S. production forecast at 184 million boxes (7.15 million metric tons), down 17 percent from December 1, 18 percent less than last season, but 4 percent above the 1981-1982 season. Forecast all oranges in Florida, 129 million boxes, down 23 percent from last month and 8 percent less than last season's crop. Early and mid-season varieties in Florida, 74.0 million boxes, down 21 percent from December 1 forecast--but 5 percent more than last season. Valencia forecast now 55.0 million boxes, 26 percent below December 1 forecast and 21 percent below last season.

California crop forecast 49.0 million boxes, up 7 percent from last month, but 36 percent less than record high production harvested last season. Navel crop, 30.0 million boxes, up 11 percent from December 1, 25 percent below last season's record high crop. Valencia forecast, 19.0 million boxes, unchanged from December 1, 47 percent less than record high crop last season. The 1982-83 California Valencia crop production has been revised to 35.9 million boxes due to a longer than usual marketing season, which ended December 15, 1983.

Arizona all orange forecast, 3.00 million boxes, 6 percent below December 1 and 21 percent less than last season. Texas crop--3.00 million boxes, down 43 percent from last month, 47 percent below 1982-83.

Changes in U.S. production between January 1 forecast and final production have averaged 16.0 million boxes over past ten seasons, ranging from 580 thousand boxes in 1982-83 to 43.2 million boxes in 1981-82. Freeze in Florida, during January 1982 major cause for 43.2 million box difference between Janaury 1, 1982 and final estimate.

FLORIDA GENERAL CITRUS: Citrus groves located in the lower east coast, lower west coast and south central part of Florida generally had very little damage from freezing temperatures December 25 and 26. Most other citrus growing areas had varying degrees of fruit icing depending on the location and number of hours below 28 degrees--conditions prevailing in many north central and central citrus groves. Soil moisture was generally very good when the freeze occurred, however, temperatures were above normal during all of December prior to the Christmas freeze. It is still too early to determine twig or wood damage. There will be considerable defoliation where temperatures were below 26 degrees for long period of time. The last week of December, harvest of freeze-damaged early and mid-season oranges increased rapidly as all processing plants started operating 24 hours a day, 7 days a week.

FLORIDA FROZEN CONCENTRATED JUICE YIELD: Forecast 1983-84 Florida FCOJ yield is now 1.23 gallons per box at 42.0 degrees Brix equivalent. The yield forecast is an estimate of the season average which will be reported at end of the season by the Florida Citrus Processor's Association. The FCOJ yield projection last month was 1.43 gallons per box. Final season average for 1982-83 was 1.48305 gallons per box and 1.27730 gallons per box for 1981-82 at 42.0 degrees Brix equivalent.

GRAPEFRUIT: Production forecast, including California's "other areas" grapefruit, 54.0 million boxes (2.01 million metric tons), down 15 percent from December 1 forecast, 6 percent less than last season. First forecast California's "other areas" crop will be April 1. Production for California 1982-83 "other areas" crop 3.20 million boxes. Florida all grapefruit forecast 43.0 million boxes--down 7 percent from last month, but 9 percent above 1982-83 crop. Texas forecast, 4.50 million boxes, down 61 percent from December 1, and 60 percent less than last season. California "Desert Valley" forecast remains at 4.20 million boxes, 2 percent more than 1982-83 harvest. Arizona forecast, now 2.30 million boxes, up 5 percent from previous month, but 15 percent less than last season. As of January 1, 13.2 million boxes had been harvested this year, or 24 percent of the U.S. grapefruit crop, compared with 17.1 million boxes, or 28 percent of the U.S. crop January 1, a year ago.

LEMONS: Arizona and California expect 26.3 million boxes (905 thousand metric tons), 1 percent less than December 1, but 5 percent above last season. Harvest is 28 percent complete--slower than last year's pace. Picking continues in all districts with movement from the important southern coastal area to be in full volume by March. Fruit quality and color are excellent.

TANGELOS: Florida crop, excluding K-early citrus fruit, 3.20 million boxes (131 thousand metric tons), unchanged from December 1, 16 percent less than 1982-83. Picking was active during December with about 83 percent complete by month's end.

TANGERINES: Forecast at 4.80 million boxes (181 thousand metric tons), down 17 percent from December 1, 9 percent less than last season. Harvest virtually complete in Florida. Harvest of California desert area tangerines and central valley Satsuma mandarins remains active.

TEMPLES: Florida forecast 2.50 million boxes (103 thousand metric tons), down 44 percent from December 1, 47 percent below last season. As of January 1, only 2 percent had been harvested.

PAPAYAS: Hawaii fresh papaya production forecast at 4.40 million pounds (2000 metric tons) for January, unchanged from December, but 23 percent above year ago. Fresh production expected to decline seasonally in February and March to 3.90 and 3.40 million pounds (1770 and 1540 metric tons), respectively, before increasing to 4.70 million pounds (2130 metric tons) in April.

December production estimated at 4.40 million pounds (2000 metric tons), a 27 percent decline from previous month, but 8 percent above year ago level. Total area in crop increased 1 percent to 3650 acres (1480 hectares) in December a record high for fifth consecutive month. Of this total area, 2285 acres (920 hectares) were harvested, a 4 percent increase from previous month.

HAY STOCKS ON FARMS: Stocks on farms January 1, 1984, 90.7 million tons (82.3 million metric tons), 15 percent less than a year ago, and 9 percent below January 1, 1982. Reduced stocks from January 1, 1983 are due to lower production and increased feeding during harsh winter.

Disappearance May 1, 1983 to January 1, 1984, 81.3 million tons (73.8 million metric tons), 14 percent more than same period a year earlier.

POTATOES: The 1984 winter potato crop forecast 2.68 million cwt (121 thousand metric tons), up 22 percent from 1983 and 18 percent above two years ago.

California winter potato crop 1.34 million cwt, a gain of 6 percent from last year, primarily because of increased acreage. Average yield expected 240 cwt per acre, down 30 cwt per acre from 1983. Planting completed last week of December. Stands and progress good with little damage from holiday freezes. Harvest of early fields expected late January.

In Florida, winter potatoes forecast 1.33 million cwt this year, up 44 percent from 1983. Acreage and expected yield both up from last year, although some fields frost damaged in Martin County.

Revised 1983 spring potato production totaled 18.3 million cwt (831 thousand metric tons), down 11 percent from 1982 and 12 percent from 1981. Area harvested 77.4 thousand acres (31.3 thousand hectares), down 1 percent from both of the last two years. Average yield fell to 237 cwt per acre, after posting a near record 264 cwt in 1982.
