MARCH FARM EMPLOYMENT MATCHES LAST YEAR'S; APRIL 1 FARM WAGE RATES SHOW LITTLE CHANGE

Farm employment in late March totaled 6.0 million workers - approximately the same as a year earlier. Family workers during the survey week of March 19-25 were estimated at 4.7 million, about 1 percent less than a year earlier. Hired workers reached a total of 1.3 million or nearly 4 percent more than in the comparable week of March 1960. Since last year's weather at this period was distinctly unfavorable for farm work, the matching of the 1960 level does not signal a change from the general downtrend of farm employment which has persisted over a long period. Compared with the 5-year (1955-59) average for March, the estimated level of total farm employment for March 1961 is down 11 percent, family workers down 12 percent, and hired workers down 3 percent.

The promise of earliness for crop field work which was quite general in late February faded in March over much of the country under continued wet weather. By the week of March 19-25, significant advances in farm employment over a year earlier were mainly limited to South Atlantic and East South Central regions. The South Central region had 2 percent more workers than in March 1960 and 8 percent more hired workers. In the East South Central region, total workers exceeded last year by 2 percent and hired workers by 15 percent.

Farm Wage Rates Show Only Slight Advance

Farm wage rates Nation-wide on April 1, 1961 averaged very close to the levels of a year earlier. The composite rate per hour of \$0.757 compares with \$0.751 on April 1, 1960. For most hiring arrangements the rates averaged about 1 percent higher than a year earlier. Seasonally adjusted however, the index of the U.S. average of composite wage rates is 647 percent of the 1910-14 average or virtually the same as April 1, 1960. This is the smallest annual change between April 1 rates since 1954.

This halt in the upward climb in wage rates as compared with a year ago is by no means even or uniform between States or areas and may not be characteristic of the entire season. Recently, farm labor has been in fully adequate supply for most needs at this time of year. Good demand exists for qualified regular help. As the season develops wage trends will continue to reflect the pressures of seasonal jobs and the growing capabilities of machines and new methods to meet them.

March Wet and Slow but Could Favor Later Work

March this year was outstandingly wet in many parts of the Nation. The soggy fields stalled an early rush of spring work and by the end of the month the prospect for spring field work changed from earliness to near normal progress. Time remains for advantageous planting of most spring crops and earliness in spring seeding still is likely in western parts of the Northern Plains. Although rainfall appeared excessive over extensive Central and Eastern areas many reporters see in the filled soil moisture bank a probable advantage to production and work efficiency during the summer growing months. In many Western irrigation areas, the March moisture additions, while most welcome, were too small to dispel the danger of summer water shortage. Comments from these sections mention the March job of lining irrigation ditches to reduce losses of precious water.

Peach and other fruit crops received only minor cold damage during the past month and retain their early prospects for a good harvest. Growers in the Southeastern peach areas report that thinning the heavy set to produce good fruit sizes will be an important job.

Applying fertilizer was a common March job on many farms. Barn and feed-lot manure was cleared out and spread as fields permitted.

Livestock work and chores continued to bulk large in the daily routine on many farms during the past month. Conditions generally favored young livestock and prospects brightened for good spring and early summer pasturage and easy times for livestock as the rains fell. Goat shearing in Texas was almost completed by the end of March, spring lambing was about over on the Edwards Plateau and Trans-Pecos, and sheep shearing was widespread over the State. Wyoming range lambing and shearing had not started but lambing of farm flocks both here and in Montana was well along.

Citrus harvest continued with California navel harvest well along and Valencia harvest starting in the eastern San Joaquin area. Lemon picking continued. Florida orange conditions were favorable as the beginning of picking neared for the Valencia crop.

Early spring vegetable work was active in Florida with harvest of most major crops heavy during the survey week. Arizona lettuce harvest moved rapidly and reached peak volume in the Salt River Valley. California land preparation, planting, and vegetable harvest followed the usual spring pattern of amazing variety.

In the Northeast, the maple-sirup flow had an intermittent run which averaged longer than usual with reports of high quality.
