On-Farm Grain Storage Capacity Up 4 Percent From Last Year

The United States on-farm storage capacity totaled 12.1 billion bushels on December 1, 2007, up 4 percent from December 1, 2006. Iowa continues to lead all States with 1.90 billion bushels of on-farm storage capacity followed by Illinois with 1.37 billion bushels and Minnesota with 1.33 billion bushels. Other major States include Nebraska with 1.10 billion bushels and North Dakota with 760 million bushels of on-farm storage capacity. These five States account for 53 percent of the Nation's on-farm storage capacity. On-farm grain storage capacity includes all bins, cribs, sheds, and other structures located on farms that are normally used to store whole grains, oilseeds, or pulse crops.

Off-Farm Grain Storage Capacity and Facilities

Capacity of off-farm commercial grain storage totaled 9.06 billion bushels in the United States on December 1, 2007, up 3 percent from December 1, 2006. Twenty-six States showed increases in capacity from a year ago while eight States recorded decreases and nine States were unchanged. The largest increase occurred in Iowa where an additional 100 million bushels of capacity were added since December 1, 2006. Other notable increases were shown in North Dakota where capacity increased 25.7 million bushels and in Illinois where capacity was up 25.2 million bushels. The largest decreases were recorded in Washington where capacity decreased 5.14 million bushels, and California where capacity decreased 3.04 million bushels from last year.

Illinois continued to lead all States in off-farm storage capacity, followed by Iowa, Kansas, Nebraska, and Texas. These 5 States accounted for 52 percent of the Nation's off-farm storage capacity on December 1, 2007.

Off-farm grain storage capacity includes all elevators, warehouses, terminals, merchant mills, other storage, and oilseed crushers which store whole grains, soybeans, canola, flaxseed, mustard seed, safflower, sunflower, rapeseed, Austrian winter peas, dry edible peas, lentils, and chickpeas/garbanzo beans. Capacity data exclude facilities used to store only rice or peanuts, oilseed crushers processing only cottonseed or peanuts, tobacco warehouses, seed warehouses, and storage facilities that handle only dry edible beans, other than chickpeas/garbanzo beans.

Off-farm storage facilities totaled 9,165 on December 1, 2007, down 1 percent from December 1, 2006. States with the largest number of facilities are Illinois with 910, Iowa with 900, Kansas with 745, Minnesota with 585, and Nebraska with 486.

Reliability of December 1, 2007 Grain Stocks Estimates

Survey Procedures: The grain stocks estimates in this report are based on surveys conducted during the first 2 weeks of December. Separate surveys are conducted to obtain the on-farm and off-farm estimates. The on-farm stocks survey is a probability survey that includes approximately 86,000 operators selected from a list of producers that ensures all operations in the U.S. have a chance to be selected. These producers are asked to provide the total quantities of grain stored on their operations as of December 1, 2007. This includes all whole grains and oilseeds stored whether for feed, seed, or sale as well as any stored under a government program.

The off-farm stocks survey is an enumeration of all known commercial grain storage facilities. This includes approximately 9,200 facilities with about 9.06 billion bushels of storage capacity. An effort is made to obtain a report from all facilities. Reports of stock holdings are normally received from operations covering about 90 percent of the capacity. Estimates are made for missing facilities to make the survey complete.

Estimation Procedures: On-farm and off-farm survey data are reviewed at the State and national levels for reasonableness, consistency with historical estimates, and current crop size. After estimates are made for on-farm and off-farm stocks, the totals of these two are combined and evaluated using the balance sheet approach. This method utilizes other sources of data to check the reasonableness of the stocks estimates. Estimates of production, imports, exports, crushings, millings, and all other recorded uses of grains and oilseeds are reviewed to make sure beginning stocks, production, utilization, and ending stocks are within reasonable balance and present the best possible estimate of stocks.

Revision Policy: On-farm and off-farm stocks are subject to revision the quarter following initial publication and again in the following December 1 *Grain Stocks* report published in January each year. Revisions can be made when late reports are received, errors are detected in reporting and calculations, and production estimates are revised. Estimates will also be reviewed following the 5-year Census of Agriculture. No revisions to these years will be made after that date.

Reliability: Reliability of the on-farm and off-farm stocks must be treated separately because the survey designs for the two surveys are very different. The on-farm stocks estimates are subject to sampling variability because all operations holding on-farm stocks are not included in the sample. This variability, as measured by the relative standard error at the U.S. level, is approximately 1.8 percent for corn, 2.1 percent for soybeans, and 2.7 percent for all wheat. This means that chances are approximately 95 out of 100 that survey estimates for stocks will be within plus or minus 3.6 percent for corn, 4.2 percent for soybeans, and 5.4 percent for all wheat of the value that could be developed by averaging the estimates produced from all possible samples selected from the same population and surveyed using the same procedures. The relative standard errors for sorghum, barley, and oats are 7.9, 3.5, and 3.6 percent, respectively.

Survey indications are also subject to non-sampling errors such as omission, duplication, imputation for missing data, and mistakes in reporting, recording, and processing the data. Off-farm, as well as on-farm stocks, are subject to these types of errors. These errors cannot be measured directly, but they are minimized through rigid quality controls in the data collection process and a careful review of all reported data for consistency and reasonableness.
