- * Intentions

INVENTORY DOWN 5 PERCENT

Inventory of all hogs and pigs on September 1, 1981, in the 14 States conducting quarterly hog surveys, is estimated at 52.2 million head, 5 percent below last year and 9 percent less than September 1, 1979, according to the Crop Reporting Board.

-- Breeding inventory, at 7.06 million head, was 5 percent less than a year ago and 15 percent below two years earlier.

-- Market hog inventory, at 45.1 million head, was 6 percent less than a year ago, and 8 percent below September 1, 1979.

Estimates for the 14 Quarterly States account for about 86 percent of the U.S. total hog and pig inventory.

PIG CROP

The June-August 1981 pig crop in the 14 States totaled 20.2 million head, 1 percent fewer than in 1980 and 11 percent below 1979. There were 2.74 million sows that farrowed during June-August, a decrease of 4 percent from a year ago and a reduction of 13 percent from the same period two years ago.

Sows farrowing averaged 7.37 pigs per litter compared with 7.18 a year earlier and 7.16 two years ago.

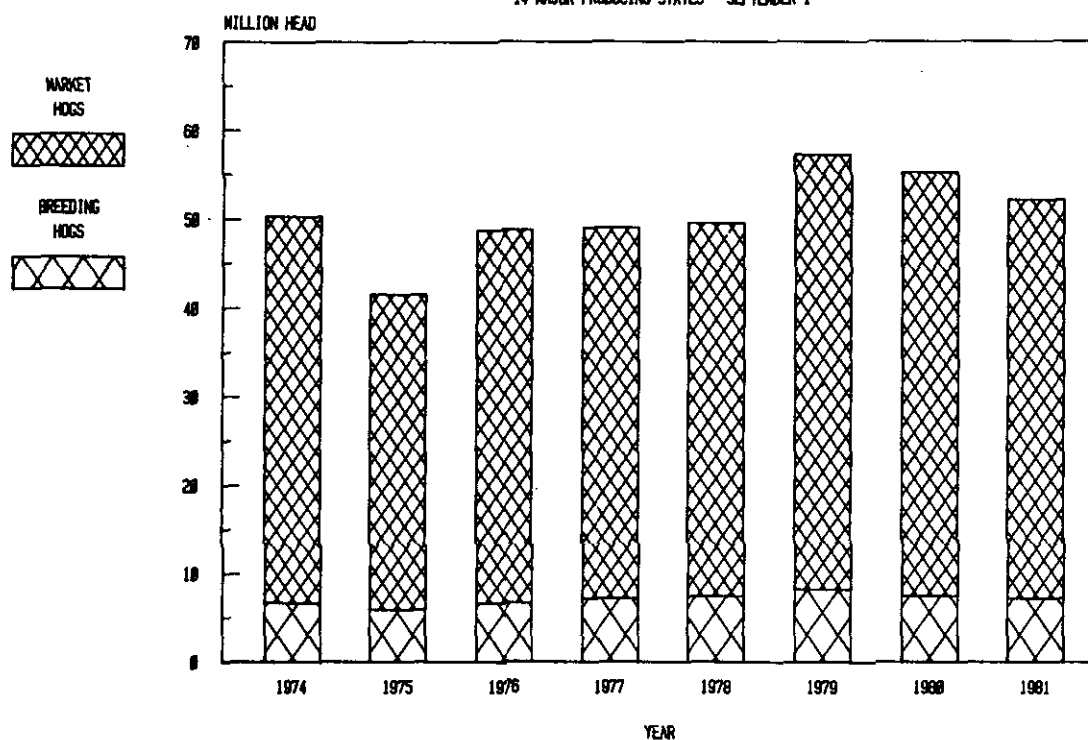

FARROWING INTENTIONS

Hog producers in the 14 Quarterly States intend to farrow 2.73 million sows during September-November, 6 percent fewer than during the comparable period in 1980 and 10 percent less than two years earlier.

Farrowing intentions for the December 1981-February 1982 period are 2.40 million sows, 1 percent less than the same period a year earlier and 12 percent below two years ago.

1/ 1979 AND 1980 DO NOT ADD DUE TO ROUNDING.

RELIABILITY AND ESTIMATING PROCEDURES: Primary data used in setting these hog estimates were obtained from a sample of farmers across the U.S. using probability surveys. Information was collected by mail, telephone and personal interviews. Since all operations raising hogs were not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about two percent at the U.S. level for hog inventory. This means that chances are approximately 95 out of 100 that survey estimates will be within four percent of the complete coverage value if the same procedures were used to survey all producers. Survey estimates are also subject to non-sampling errors such as omissions, duplications, and mistakes in reporting, recording and processing the data. These errors cannot be measured directly, but they are minimized through rigid quality controls in the data collection process and a careful review of all reported data for consistency and reasonableness.

The sampling variability of survey estimates on intended farrowings is slightly larger than that for inventories. More important, actual farrowings may differ significantly from reported intentions due to unexpected economic and environmental conditions. These differences have exceeded four percent for about one-third of the quarterly periods during the last seven years.

In setting the inventory estimates, the Crop Reporting Board constructed a U.S. balance sheet using estimates on births, deaths and check data on slaughter, imports and exports. This balance sheet provided an additional check on survey results.
