RELEASED: March 20, 1984
3:00 P.M. ET

In this Issue:

- * Inventories
- * Pig Crop
- * Intentions

INVENTORY DOWN 5 PERCENT

Inventory of all hogs and pigs on March 1, 1984, in the 10 States conducting quarterly hog surveys, is estimated at 39.5 million head, 5 percent below last March, according to the Crop Reporting Board. This is 3 percent below March of 1982 and the lowest March inventory since 1976.

-- Breeding inventory, at 5.35 million head, was 10 percent less than a year ago and 4 percent less than March 1982. This is the lowest March breeding herd inventory since 1973 when estimates for these comparable 10 States became available.

-- Market hog inventory, at 34.2 million head, was 5 percent below last year and 2 percent below two years ago.

PIG CROP

The December 1983-February 1984 pig crop was 13.5 million head, 13 percent less than last year and 4 percent below two years ago. There were 1.86 million sows that farrowed during the quarter, a decrease of 11 percent from a year ago and 6 percent below the same period two years ago.

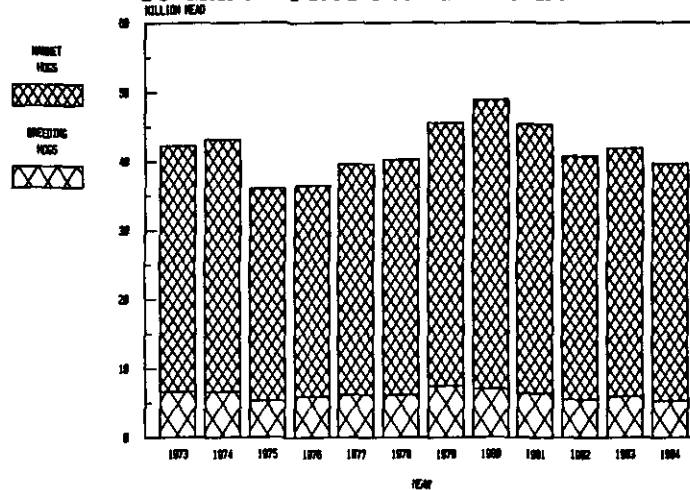

Sow farrowings averaged 7.26 pigs per litter compared with 7.44 last year and 7.11 two years ago.

FARROWING INTENTIONS

Hog producers in the 10 quarterly States intend to farrow 2.48 million sows during March-May of this year. This is 11 percent less than actual farrowings during the comparable period in 1983, but 4 percent more than two years ago. Farrowing intentions for June-August are 2.10 million head, 13 percent below the same period last year and 5 percent less than two years ago. If these intentions are realized, this will be the lowest June-August farrowings since 1975.

1/ 1976, 1977 AND 1984 DO NOT ADD DUE TO ROUNDING.

RELIABILITY AND ESTIMATING PROCEDURES: Primary data used in setting these hog estimates were obtained from a sample of farmers across the 10 States using probability surveys. Information was collected by mail, telephone and personal interviews. Since all operations raising hogs were not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about two percent at the 10 State level for hog inventory. This means that chances are approximately 95 out of 100 that survey estimates will be within four percent of the complete coverage value if the same procedures were used to survey all producers. Survey estimates are also subject to non-sampling errors such as omissions, duplications, and mistakes in reporting, recording and processing the data. These errors cannot be measured directly, but they are minimized through rigid quality controls in the data collection process and a careful review of all reported data for consistency and reasonableness.

The sampling variability of survey estimates on intended farrowings is slightly larger than that for inventories. More important, actual farrowings may differ significantly from reported intentions due to unexpected economic and environmental conditions. For March-May second intentions these differences have exceeded four percent in two of the last ten years. For June-August first intentions these differences have exceeded five percent in two of the quarterly pig crops during the past ten years.

In setting the inventory estimates, the Crop Reporting Board constructed a balance sheet using estimates on births, deaths and check data on slaughter. This balance sheet provided an additional check on survey inventory estimates.

APPROVED:

Richard E. Lyng
