

MILK PRODUCTION

APRIL 1969

Release:
May 12, 1969
3:00 P.M. EDT

April milk production 2 percent below a year earlier

U. S. milk production in April is estimated at 10,261 million pounds, 2 percent less than a year earlier and the smallest April production since 1952. Daily average production for April was up 6 percent from March, the same seasonal gain as a year earlier. April output provided 1.69 pounds of milk per person daily for all uses, compared with 1.59 pounds in February and 1.74 pounds a year earlier. Daily average production during the first 4 months of 1969 was 1.6 percent less than a year earlier.

Milk production less in most States

Only 14 States reported April production above a year earlier, 11 were unchanged and all others were down. Production changes were mixed in the North Atlantic, South Central and Western States, and down in most States of the other regions.

April rate per cow up 1 percent from a year earlier

Milk output per cow averaged 807 pounds during April, 1 percent more than a year earlier. In some areas of the Midwest, farmers were unable to turn cows out to pastures because of wet, soft soil. Daily output in April averaged 26.9 pounds per cow, 6 percent more than in March, and the same increase as reported a year earlier. Production per cow was at record high levels for April in 37 States-- highest in California and Washington, both at 960 pounds. Minnesota and Arizona both had 925 pounds; New Jersey, 915 pounds; and Hawaii, 910 pounds.

Milk-feed price ratio continues at record high level

The April milk-feed price ratio of 1.68 was 5 percent above the previous record for April set in 1968. Seasonally, it was down 2 percent from March. The ratio had declined 1 percent a year earlier. Higher milk prices and slightly cheaper ration values caused the increase over April 1968. Regionally, the ratio was lowest in the North Atlantic and highest in the South Atlantic States.

Special in this issue:
CONCENTRATE RATIONS FED TO MILK COWS 1968, page 6.

May 1 Pastures Best Since 1958:

Good to excellent pasture condition prevailed throughout the Nation on May 1. The U.S. average, at 87 percent of normal, was the best condition reported for the date since 1958. April temperatures were generally normal or above, except for a section of the Far West. Precipitation was less than normal in the Southeast.

On May 1, reported pasture condition was 85 percent of normal or better in the North Atlantic, North Central and South Central States except in New Jersey. North Dakota reported 86 percent--exceeded only once in half a century of records. This State's only poor areas--on the Canadian border--resulted from an excess of water rather than dryness. May 1 condition of 90 percent in Kansas was 19 points above a year earlier and the best for the date since 1945.

All South Atlantic States except Florida reported condition at 83 percent or better on May 1. At 77 percent, Florida showed a 12-point improvement in April and a 20-point increase over a year earlier.

In the Western Region, only two States reported condition below 85 percent. May 1 condition was the best in nearly 40 years in Montana, and best in a decade for Idaho, Wyoming, and California. Colorado reported 75 percent--the lowest of any State, and New Mexico was a close second with 76 percent on May 1.

GRAIN AND OTHER CONCENTRATES FED TO MILK COWS, 1968

Feeding rates up in 1968

The quantity of grain and other concentrates fed to milk cows increased slightly in 1968 despite a 4 percent decrease in the number of milk cows. Tonnage fed in 1968 was 22.9 million--0.4 percent above a year earlier. Farmers fed 3,519 pounds of grain and concentrates per milk cow--4 percent above 1967. Feeding rates per cow ranged from 3,271 pounds in the South Central Region to 3,726 pounds in the South Atlantic. On a State basis, the highest feeding rate was in Florida, followed by Connecticut, Oklahoma, and Texas. Grain and concentrates fed per 100 pounds of milk produced was 39.1 pounds, exceeding the 1967 rate by 2 percent. This rate ranged from 32.7 pounds in the West to 48.4 pounds in the South Central. By States, Florida fed the most grain and concentrate per 100 pounds of milk, followed by Louisiana, Mississippi, Arkansas, and Alabama.

Corn and commercial feed most important

Corn continued as the leading concentrate fed to milk cows in 1968 but commercially mixed feed was only slightly lower. The percentage of corn was 37.4 while commercially mixed feeds represented 36.6 percent of the total concentrate ration. The proportion of corn used in rations has continued about the same in recent years while commercially mixed feed has been increasing. Together, these two feeds represented about three-fourths of the concentrates fed in 1968. Corn was the most important feed in the East and West North Central Regions while commercial mixes led in all other regions. Oats represented 12 percent of the U. S. ration and about one-fifth of the ration in the North Central Region. Each of the other feeds represented less than 5 percent of the national total, although some were important on a State or Regional basis. Home grown grains represented 40.8 percent of the total concentrate ration fed to milk cows in 1968, compared with 40.5 percent in 1967.

Value of concentrate ration

The average value of concentrate ration fed to milk cows is estimated at \$3.10 per 100 pounds in 1968. This is a 12¢ decrease from a year earlier. Seasonally, the U. S. ration value ranged from \$3.14 during the first 4 months of 1968 to a low of \$3.04 during October. Average ration value for 1968 was highest in the North Atlantic Region and lowest in the West North Central, where home-grown grain represents a large percentage of the total.

Milk-feed price ratio highest of record in 1968

The 1968 milk-feed price ratio averaged 1.70, up 9 percent from 1967 because of higher milk prices and lower ration values. The ratio was at record high levels in all months of 1968. Regionally, the annual average varied from 1.61 in the North Atlantic to 1.87 in the South Atlantic.

1/ Pounds of concentrate ration equal in value to 1 pound of whole milk sold by farmers to plants and dealers. Obtained by dividing the price per 100 pounds received by farmers for milk (as published in the report, Agricultural Prices) by the value per 100 pounds of concentrate rations fed to milk cows.

2/ Revised.
