
NONCITRUS FRUITS & NUTS

MIDYEAR SUPPLEMENT

PRODUCTION, USE, AND VALUE

* The Crop and Livestock estimating program was modified in 1982 to *
* stay within the fiscal 1982 funding level. As part of this modifica- *
* tion process, estimates for a number of data series were either dis- *
* continued or curtailed. Estimates for commercial apple production by *
* varieties and all estimates for blueberries and other bushberries *
* were among the data series discontinued. With the exception of these *
* three data series, the content of this publication is the same as in *
* recent years. *

Unutilized Production - is the difference between total and utilized production which is fruit not harvested for economic or natural reasons and harvested fruit not sold or utilized.

Utilization - refers to first utilization, not necessarily final utilization. For example, frozen fruit includes some fruit that may be later used for making preserves. Grade-outs for fresh market fruit which are processed are included in the processing quantity. Fruit graded-out from canning or freezing and utilized for juice is included with juice.

Apples, Commercial Crop - orchards of 100 or more bearing age trees.

Prices - are a season average for all methods of sale. For a crop sold for both fresh market and processing, the season average price is a weighted average of the fresh and processing price.

Prices for fresh fruit are the average prices producers receive at the point of first sale. This is commonly referred to as the average price as sold. Since the point of first sale is not the same for all producers, prices for the various methods of sale are weighted by the proportionate quantity sold. For example, if in a given State part of the fruit is sold f.o.b. packed by growers, part is sold as bulk fruit at the packinghouse door, and some is sold retail at roadside stands, the fresh fruit average price as sold is a weighted average of the average price for each method of sale. The exception is fresh fruit sales in California, Washington and Oregon which are equivalent returns at packinghouse door. The equivalent packinghouse returns represent adjusted prices.

F.o.b. packed prices are adjusted to an equivalent incoming packinghouse door price by subtracting all costs that accumulate between the incoming packinghouse door and the f.o.b. price. These costs include grading, packing, inspecting fees, selling, and other costs.

Prices for fruit sold for processing are equivalent returns for fruit delivered to the processing plant door except for cranberries and California olives and clingstone peaches which are priced at the first delivery point.

Crop value estimates in this report cover the marketing season or crop year and should not be confused with cash receipts from these crops which are on a calendar year. The following procedure is used to compute State values for all commodity groups:

State Value Computation Procedure

$$\begin{aligned}
 \text{Fresh Market Value} &= \text{Fresh Market SAP} \quad \times \quad \text{Fresh Market Utilization} \\
 \text{Process Market Value} &= \text{Process Market SAP} \quad \times \quad \text{Process Market Utilization} \\
 \text{"All" Sales Value} &= \text{Fresh Market Value} \quad + \quad \text{Process Market Value} \\
 \text{"All" Sales SAP} &= \frac{\text{"All" Sales Value}}{\text{"All" Sales Utilization}}
 \end{aligned}$$

For commodities with components not identified by market channel, substitute breakdown name for fresh/processing market and use the same procedure. The procedure used for computation of U.S. season average prices follows:

U.S. SAP Computation Procedure

$$\begin{aligned}
 \text{Fresh Market SAP} &= \frac{\text{Fresh Market Value for all States}}{\text{Fresh Market Utilization for all States}} \\
 \text{Process Market SAP} &= \frac{\text{Process Market Value for all States}}{\text{Process Market Utilization for all States}} \\
 \text{"All" Sales SAP} &= \frac{\text{Sales Value for all States}}{\text{Sales Utilization for all States}}
 \end{aligned}$$
