## 2007 Noncitrus Fruit Utilized Production Down 1 Percent, Value Up 5 Percent

In 2007, the Nation's utilized production of the leading noncitrus fruit crops totaled 16.6 million tons, down 1 percent from the 2006 utilized production. Utilized production decreased from 2006 for California prunes, prunes and plums (ID, MI, OR, and WA), loganberries, California all raspberries, California plums, Oregon black raspberries, California kiwifruit, cranberries, California dates, red raspberries, and apples.

The value of utilized production for noncitrus fruit crops totaled 11.0 billion dollars, up 5 percent from 2006. The value of utilized production for California olives increased 378 percent, apricots increased 45 percent, California dates are up 29 percent, red raspberries are up 29 percent, sweet cherries increased 25 percent, and tart cherries are up 24 percent. However, the utilized value of production for Oregon black raspberries decreased 63 percent, California prunes are down 58 percent, prunes and plums (ID, MI, OR, and WA) decreased 43 percent, boysenberries decreased 35 percent, nectarines decreased 29 percent, and Oregon blackberries are down 21 percent.

### Highlights

**Utilized apple** production for 2007 is estimated at 9.30 billion pounds, down 6 percent from 2006. Utilized apple production in Washington decreased 4 percent to 5.40 billion pounds from 2006. Michigan's utilized production decreased 10 percent from 2006, while utilized production in New York increased 2 percent from 2006. A change in varieties produced was the primary reason for the reduction in Washington production with more growers switching from the Red Delicious variety. In New York, hailstorms damaged some of the crop; however, apple numbers and quality were high. Low summer precipitation levels in Michigan reduced fruit sizes but fruit quality remained high. A severe frost decimated orchards in the Southeast and Iowa, Missouri, Illinois, and Kentucky. Reports of tree damage and total crop loss were common in these States.

**Utilized grape** production for 2007 totaled 6.73 million tons, up 6 percent from the 2006 crop. The California crop, which accounts for 88 percent of the 2007 U.S. utilized grape production, is up 3 percent from the previous year. Also for California, wine type production increased 1 percent, while table type and raisin type production rose 5 percent and 6 percent from 2006, respectively. Utilized production increased from 2006 in all grape States except Arkansas, Georgia, Missouri, North Carolina, and Virginia. In the south, a freeze Easter weekend damaged grape vines, reducing the crop in many southern States.

**Utilized peach** production in 2007 is estimated at 1.10 million tons, up 12 percent from the previous year but 4 percent below 2005. The California crop, accounting for 85 percent of the U.S. utilized peach production, is up 31 percent from 2006. For California, the Clingstone utilized production is up 40 percent and the Freestone utilized production is up 22 percent from 2006. Cold temperatures in early April damaged peach orchards in the Atlantic States from New York to Georgia, with the southeastern States being affected the most.

**Utilized pear** production for 2007 is 879,850 tons, up 6 percent from the previous year. Washington, the top producing State, utilized 409,000 tons, up 13 percent from 2006. California, the second largest producer at 243,000 tons, is up 6 percent from the previous season. Utilized pear production in Oregon, the third largest producing State, is 207,000 tons, down 4 percent from 2006.

## U.S. Tree Nut Production Up 20 Percent, Value Up 5 Percent

U.S. tree nut production for crop year 2007 is estimated at 1.92 million tons (in-shell basis), 20 percent greater than a year earlier. The almond crop is 1.17 million tons, up 22 percent from 2006. Walnut production in 2007, at 320,000 tons, is down 8 percent from the previous year. The pistachio crop is 205,000 tons, 72 percent larger than 2006. Pecan production in 2007 totals 174,600 tons, a 69 percent increase from 2006. The hazelnut crop, at 36,000 tons, is 16 percent smaller than the previous year. Macadamia nut production is 18,000 tons, down 38 percent.

Value of U.S. utilized nut production in 2007 is estimated at 3.86 billion dollars, up 5 percent from the 2006 value. The almond crop is valued at 2.32 billion dollars, 3 percent more than last year. Pistachio value for 2007, at 549 million dollars, is 22 percent more than last year. The value of the pecan crop increased 17 percent to 376 million dollars. Hazelnut value, at 65.5 million dollars, is 41 percent above last year. The macadamia nut crop is valued at 21.6 million dollars, down 44 percent.

## Definition of Terms

**Apples, Commercial Crop** refers to orchards of 100 or more bearing age trees.

**Bearing Acreage** - An orchard, grove, or vineyard is considered bearing when it reaches an age when it can normally be expected to produce a commercially significant quantity of the crop. Bearing age is a function of many factors including variety, rootstock, year planted, etc. Bearing acreage is primarily based upon periodic orchard surveys. In non-survey years, bearing acreage is based on trends, county extension service data, end-of-year production surveys, and other indications.

**Prices** are a marketing year average for all methods of sale. For a crop sold for both fresh market and processing, the **Marketing Year Average Price (MYA)** is a weighted average of the fresh and processing price.

Prices for fresh fruit are the average prices producers receive at the point of first sale. This is commonly referred to as the **average price as sold**. Since the point of first sale is not the same for all producers, prices for the various methods of sale are weighted by the quantity sold. For example, in a given State, part of the fruit is sold free on board (F.O.B.) packed by growers, part is sold as bulk fruit at the packinghouse door, and some is sold retail at roadside stands. The fresh fruit **average price as sold** is a weighted average of the average price for each method of sale. The exception is fresh fruit sales in California, Washington, and New York (apples only) which are equivalent returns at packinghouse door. The equivalent packinghouse returns represent adjusted prices.

F.O.B. packed prices are adjusted to an equivalent incoming packinghouse door price by subtracting all costs that accumulate between the incoming packinghouse door and the F.O.B. price. These costs include grading, packing, inspecting fees, selling, and other costs.

Prices for fruit sold for processing are equivalent returns for fruit delivered to the processing plant door except for cranberries, California olives, and freestone peaches, which are priced at the first delivery point.

Crop value estimates in this report cover the marketing season or crop year and should not be confused with cash receipts from these crops which are on a calendar year.

**Total Production** is the quantity actually harvested plus quantities which would have been acceptable for fresh market or processing but were not harvested because of economic or natural reasons.

**Unutilized Production** is the difference between total and utilized production which is marketable fruit not harvested for economic or natural reasons and harvested fruit not sold or utilized.

**Harvested not sold** is fruit of marketable quality that was picked but not sold for various reasons. Harvested not sold amounts up to 2 percent of total production are considered normal seasonal losses and are excluded from total production. Reported values are above and beyond these normal seasonal losses.

**Unharvested Production** is marketable fruit produced, but not harvested for various reasons. Unharvested amounts up to 2 percent of total production are considered normal seasonal losses and are excluded from total production. Reported values are above and beyond these normal seasonal losses.

**Utilization** refers to first utilization, not necessarily final utilization. For example, frozen fruit includes some fruit that may be later used for making preserves. Grade-outs for fresh market fruit which are processed are included in the processing quantity. Fruit graded-out from canning or freezing and utilized for juice is included with juice.

**Utilized Production** is the amount sold plus the quantities used at home or held in storage.

**Yield per Acre** is based on total production which includes unharvested production and fruit harvested but not sold due to marketing conditions.

### State Value of Utilized Production and MYA Price Computations

The following procedure is used to compute State Values of Utilized Production and MYA Prices:

**Fresh Market Value** = Fresh Market MYA  
Times  
Fresh Market Utilization

**Process Market Value** = Process Market MYA  
Times  
Process Market Utilization

**"All" Sales Value** = Fresh Market Value  
Plus  
Process Market Value

**"All" Sales MYA** = "All" Sales Value  
Divided By  
"All" Sales Utilization

For commodities with components not identified by market channel, substitute breakdown name for fresh/processing market and use the same procedure.

### U.S. MYA Price Computations

The following procedure is used to compute the U.S. MYA Prices:

**Fresh Market MYA** = Fresh Market Value For All States  
Divided By  
Fresh Market Utilization For All States

**Process Market MYA** = Process Market Value For All States  
Divided By  
Process Market Utilization For All States

**"All" Sales MYA** = Sales Value For All States  
Divided By  
Sales Utilization For All States

## Reliability of January Noncitrus Fruit Production Estimates

Reliability: To assist users in evaluating the reliability of the January noncitrus fruit total production estimates, the "Root Mean Square Error," a statistical measure based on past performance, is computed. The deviation between the first January total production estimate and the final estimate is expressed as a percentage of the final estimate. The average of squared percentage deviations for the latest 20-year period is computed. The square root of the average becomes statistically the "Root Mean Square Error." Probability statements can be made concerning expected differences in the current estimate relative to the final end-of-season estimate, assuming that factors affecting this year's estimate are not different from those influencing recent years. For example, the "Root Mean Square Error" for the January apple total production estimate is 3.0 percent. This means that chances are 2 out of 3 that the current production estimate will not be above or below the final estimate by more than 3.0 percent. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 5.2 percent.

Also, shown in the following table is a 20-year record for selected crops of the differences between the first January total production estimate and the final estimate. Using apples again as an example, changes between the first January estimate and the final estimate during the last 20 years have averaged 117.9 thousand tons, ranging from 6.1 thousand tons to 398.9 thousand tons. The first January estimate has been below the final estimate 8 times and above 12 times. This does not imply that the January estimate this year is likely to understate or overstate the final production.
