POTATO STOCKS DOWN 13 PERCENT

Storage of fall potatoes in the 15 major States totaled 204 million cwt on December 1, 1986. This is down 13 percent from last year but 1 percent above two years ago. Stocks accounted for 68 percent of fall production this year the same as last year. Russets were the main type stored accounting for 79 percent of the total in the 11 major States; whites made up 18 percent and reds, 3 percent.

(Comments continued on page 8)

FALL POTATOES: PRODUCTION AND STOCKS (FOR 15 STATES ESTIMATING POTATO STOCKS)

*PRODUCTION BY CROP YEAR. STOCKS BY MONTHS FOLLOWING HARVEST.

 * NOTE: Stocks are defined as the quantity remaining in storage for *
 * all purposes and uses, including shrinkage and waste and other *
 * losses that occur after the date of each report. Sales of fall *
 * potatoes for all purposes generally account for about 90 per- *
 * cent of the total fall production. Shrinkage, loss and home *
 * use account for the remaining 10 percent. *

RELIABILITY OF DECEMBER 1 PRODUCTION AND STOCKS ESTIMATES

The "Root Mean Square Error" for the December 1 stocks estimate is 2.1 percent. This means that the chances are 2 out of 3 that the current estimate of 204 million cwt will not be above or below the final estimate by more than 2.1 percent or approximately 4.29 million cwt. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 3.6 percent or approximately 7.35 million cwt.

Also shown below is the 10-year (1976-85) record of the differences between the December 1 production and stocks estimates and the final estimates. Using stocks again as an example, changes between the December 1 estimate and the final estimate during the 10 years have averaged 3.36 million cwt, ranging from 80 thousand to 5.82 million cwt. During this 10-year period, the December 1 estimate has been below the final estimate 9 out of 10 years for both production and stocks.

1986 POTATO OBJECTIVE YIELD SURVEY

The Agricultural Statistics Board conducted potato objective yield surveys in the 11 major fall producing States in 1985. Sample plots were located in potato fields that were selected on a random basis using a scientifically designed sampling procedure. Field workers recorded counts and measurements from these fields just prior to and immediately after harvest.

The sample data from the objective yield surveys shown in tables 5 and 6 are presented to provide current information about the crop and are not official estimates.

FALL PRODUCTION DOWN 12 PERCENT

Fall potato production is estimated at 311 million cwt (14.1 million metric tons) in 1986, down 12 percent from last year and 1 percent short of 1984 output. Area harvested totaled 1.03 million acres (417 thousand hectares), down 10 percent from last year and 6 percent below 1984. The average yield came to 301 cwt per acre, 7 cwt below last year's record but 15 cwt above two years ago.

The December production estimate is up 1 percent from the November 1 forecast because of larger-than-expected crops in Colorado, Washington, Oregon, and California.

Production in the SEVEN EASTERN STATES is estimated at 35.3 million cwt, down 24 percent from last year and 8 percent below 1984. Harvested acreage dropped 15 percent from last year and yields were down 11 percent. Harvest in Maine was difficult with excessive rainfall and some frost damage. Rains also slowed Upstate New York harvest. Pennsylvania yields were good, but below last year.

EIGHT CENTRAL STATES produced 72.2 million cwt of potatoes in 1986, down 11 percent from last year and 5 percent below 1984. Area for harvest declined 9 percent, while the average yield was down slightly from last year. Heavy rains in Michigan, Wisconsin, and North Dakota knocked out several thousand acres during the critical harvest time. Potatoes that were harvested went into storage in pretty good shape.

The NINE WESTERN STATES produced 203 million cwt of potatoes this year, 10 percent below last year, but 2 percent above 1984. Area harvested was down 9 percent from last year, while the average yield edged near last year's pace setter. Harvest in all of the Western States went relatively smoothly when compared with the 1985 experience. Idaho production of 87.3 million cwt was near two years ago, but 15 percent below last year.

DISAPPEARANCE from harvest to December 1 in the 15 States totaled 96.8 million cwt this year compared with 109 million cwt last year and 102 million cwt in 1984. Shrinkage and loss were considerably less and made up 15.2 million cwt of the movement compared with 20.4 million cwt last year and 16.1 million cwt in 1984.

PROCESSING in the 8 major States totaled 43.1 million cwt so far this year compared with 48.2 million cwt last year and 47.3 million cwt two years ago. Idaho processing started slowly, while other areas are near last year's pace.

Stocks in the THREE EASTERN STATES fell 32 percent from last December 1 to 22.0 million cwt, and were 15 percent below 2 years ago. Maine stocks of 15.5 million cwt were down 32 percent from a year ago, after a difficult, frost damaging harvest. New York storages contained 3.10 million cwt, down 46 percent from last year. Pennsylvania stocks of 3.40 million cwt were off 16 percent.

The SIX CENTRAL STATES stored 44.9 million cwt of potatoes on December 1 this year, down 18 percent from last year and 8 percent below two years ago. North Dakota at 15.5 million cwt was down 18 percent; Minnesota at 10.1 million cwt was off 8 percent; Wisconsin stored 11.5 million cwt, down 21 percent; and Michigan at 5.60 million cwt was down 30 percent.

Storage in the SIX WESTERN STATES was set at 137 million cwt, down 7 percent from last year, but 9 percent above 1984. Idaho stocks were 67.5 million cwt, down 9 percent from a year ago. Washington at 32.3 million cwt was down 4 percent; while Oregon at 17.0 million cwt was off 8 percent. Colorado stocks, totalling 13.6 million cwt were down 7 percent, and California at 4.70 million cwt was down 15 percent.
