## June Potato Stocks Down 23 Percent from Last Year

The 13 major potato States held 40.0 million cwt of potatoes in storage June 1, 2006, down 23 percent from last year and 13 percent below June 1, 2004, for comparable States. Ohio and Pennsylvania were dropped from the potato stocks program starting with the 2005 storage season. Potatoes in storage account for 11 percent of the 2005 fall storage States' production, down 2 percentage points from last year.

Disappearance of 333 million cwt from the start of harvest to June 1, is down 4 percent from last year for comparable States. Shrink and loss, at 24.7 million cwt, is down 23 percent from last year for comparable States.

Processors have used 167 million cwt of 2005 crop potatoes so far this season, down 3 percent from a year ago and 4 percent below 2 years ago. Idaho and Malheur County, Oregon, total processing decreased 2 percent from a year ago and Washington and the rest of Oregon total processing dropped 3 percent from last season. Dehydrating usage accounts for 33.8 million cwt of the total processing, down 12 percent from last year and 14 percent below the same date in 2004.

Comparisons by region will not be made in this narrative to avoid disclosure of individual operations. Comparisons for individual States are as follows. Idaho's potato stocks are down 27 percent from last year, while sheds in Maine held 7 percent less than last year, and Colorado's stocks dropped 39 percent from last season. Stocks in Minnesota decreased 43 percent from 2005 and North Dakota's potato stocks dropped 73 percent from last year. California, Michigan, Montana, Nebraska, and New York's potato stocks combined decreased 8 percent from the same date in 2005. Washington's potato stocks are up 13 percent from last season, while Oregon's sheds held 19 percent more than last year, and Wisconsin's stocks increased 6 percent from 2005.

## Reliability of June 1 Stocks Estimates

To assist users in evaluating the reliability of the June 1 stocks estimate, the “Root Mean Square Error,” a statistical measure based on past performance, is computed. The deviation between the June 1 stocks estimate and the final estimate is expressed as a percentage of the final estimate. The average of squared percentage deviations for the latest 7-year period is computed. The square root of the average becomes statistically the “Root Mean Square Error.” Probability statements can be made concerning expected differences in the current estimate relative to the final end-of-season estimate, assuming that factors affecting this year’s estimate are not different from those influencing recent years.

The “Root Mean Square Error” for the June 1 stocks estimate is 8.3 percent. This means that chances are 2 out of 3 that the current estimate of 40.0 million cwt will not be above or below the final estimate by more than 8.3 percent or approximately 3.3 million cwt. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 14.4 percent or approximately 5.8 million cwt.

The 7-year (1998-2004) record of differences between the June 1 stocks estimates and the final estimates averaged 2.0 million cwt, ranging from 8.5 million cwt above the final to 700,000 cwt below the final. During the 7-year period, the June 1 estimate has been above the final estimate 4 years and below 3 years.
