(See comments on reverse side.)
Transplanting of winter celery in California continues heavier than last season in south coast areas. Planting is complete in the Salinas-Watsonville district. Cutting was increasing around Salinas-Watsonville and in the Oceano area. Movement in these areas should increase in October, becoming heavy in November.

In Florida, transplanting continued at a normal rate in the Everglades. Growers in the Sarasota area began transplanting in late September. Seed beds are in excellent condition. Transplanting continues active at Oviedo and Sanford but was completed in the Zellwood area the week ending September 6.

In Arizona, celery transplanting was complete about mid-September and the crop is in good condition.
