VEGETABLES - FRESH MARKET

ANNUAL SUMMARY

1969

The 1969 estimated production of the 27 principal fresh market vegetables and melons is 2 percent less than in 1968, according to the Crop Reporting Board. The 1969 production of 221.1 million hundredweight compares with 1968 production of 225.9 million hundredweight and the 1967 production of 222.5 million. For major crops, the increases for lettuce and sweet corn were more than offset by smaller production of cabbage, carrots, celery, onions, and tomatoes. The 27 principal vegetable and melon crops had a total value of $1,230 million, 4 percent more than a year earlier. Leading crops in value were lettuce and tomatoes whose combined total accounted for 38 percent of the U.S. total.

The 1969 strawberry crop of 486 million pounds was 7 percent less than last year but 3 percent above 1967. Production for fresh market accounted for 65 percent of the 1969 strawberry crop and processing 35 percent. Also included in this report are estimates for production of mint for oil, which was valued at more than $30 million in 1969.

The five leading States in the 1969 production of fresh vegetables and melons were California, Florida, Texas, Arizona and New York. These States accounted for 67 percent of the harvested acreage, 73 percent of the production, and 77 percent of the value of the vegetables and melons produced in the United States.

Estimates in this publication relate primarily to fresh market production. While estimates for many vegetable crops include only fresh market production, those for a few crops, such as broccoli, cauliflower, and carrots, include substantial quantities processed. For asparagus and strawberries, which are perennial crops providing production for both fresh market and processing outlets from the same acreage, a utilization breakdown is given in addition to total production.

(Continued on page 63.)

Production is defined as the amount sold or utilized for all vegetables except late summer onions and Upstate New York early fall cabbage, for which production is defined as the quantity hauled from the field. Quantities not sold because of economic reasons are not included in the estimates and adjustments have been made in 1967 and 1968 where applicable.

In this publication, the volume of vegetables sold for fresh market use is valued at f.o.b. shipping point, except garlic, for which prices are reported annually on a field run basis at the packinghouse door. The volume sold for processing is valued at the processing plant door--i.e., "equivalent returns at packinghouse door." For vegetables sold both for fresh consumption and for processing, total value is the sum of the values for both types of use. Per unit value is the quotient derived by dividing total value by total quantity. "Per unit value" is not in general a "price." It is not generally used for parity purposes except where one or the other types of utilization is negligible.

Harvested acreage is defined as the acreage from which some quantity was harvested, either partially or completely. Planted acreage includes, in addition to acreage harvested, acreage lost or abandoned due to natural or economic causes. Acreage lost and replanted to the same crop for harvest in the same season is counted only once. Acreage lost and replanted to the same crop for harvest in a later season is considered to have been planted in both seasonal classifications, but is included as acreage for harvest in the second season only. Acreage lost and replanted to another vegetable crop is included as planted acreage in estimates for both crops, but as acreage harvested for the second crop only. Both planted and harvested acreage published for asparagus and strawberries, include only bearing acreage and exclude non-bearing acreage planted for harvest in future marketing seasons. Value is for the crop year and does not correspond to calendar year income.

This summary provides fresh market estimates for the 27 principal vegetables and melons grown commercially in the more important producing States. These estimates provide basic statistics on over 80 percent of the national output of all vegetables and melons grown for fresh market sale.

These data are based upon information secured from growers, shippers, processors, public agencies, and other sources.
